

Electric Shielding

Introduction

This is a tutorial application that shows how to model isolated highly conductive objects in the Electric Currents interface. The analysis includes the current terminal and electric shielding boundary conditions.

Model Definition

The modeling domain is a seawater filled box containing an electrode. The sides of the box are insulated while the top has an assigned electric potential of 1 V and the bottom is set to ground.

BOUNDARY CONDITIONS ON THE ELECTRODE

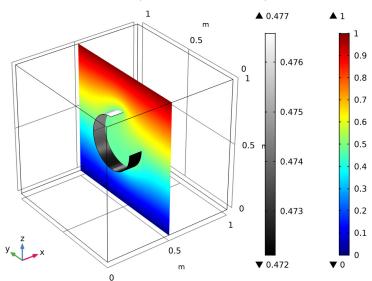

The first version of the application uses the terminal boundary condition with a zero net current. The electrode then assumes a constant potential determined by the surrounding field. This condition, also known as a floating potential condition, can be a good approximation if the electrode is a much better conductor than the surrounding medium. It can also be used for metal surfaces in electrostatics, where the zero current condition is replaced by a zero total charge.

The second version uses an electric shielding condition instead of the terminal boundary condition. The electric shielding condition requires the specification of the material constituting the thin layer and its thickness. When used for describing thin sheets of conducting materials, the electric shielding condition results in a potential that is assumed to be constant across the depth of the material, but varies on its surface.

Results and Discussion

Figure 1 shows the potential distribution when using the electric shielding condition. The electrode is modeled as a 1 mm thick sheet of titanium bent to form three quarters of a cylinder. The cylinder has a radius of 0.2 m and is centered in a cube with a 1 m side. The

result, as seen in the surface plot, is a potential that varies between 0.472 V and 0.476 V on the conductor.

Slice: Electric potential (V) Surface: Electric potential (V)

Figure 1: The electric potential distribution on the conductor and in the water when using the electric shielding condition.

For a comparison, with the zero current terminal condition, the potential on the conductor evaluates to a constant $0.474~\rm{V}$.

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

I In the Model Wizard window, click 3D.

- 2 In the Select Physics tree, select AC/DC>Electric Fields and Currents>Electric Currents (ec).
- 3 Click Add.
- 4 Click Study.
- 5 In the Select Study tree, select General Studies>Stationary.
- 6 Click Done.

GEOMETRY I

Create the model geometry, starting with the electrode.

Cylinder I (cyll)

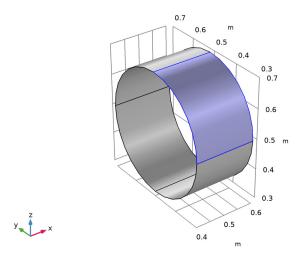

- I In the Geometry toolbar, click Cylinder.
- 2 In the Settings window for Cylinder, locate the Object Type section.
- 3 From the Type list, choose Surface.
- 4 Locate the Size and Shape section. In the Radius text field, type 0.2.
- 5 In the Height text field, type 0.2.
- 6 Locate the Position section. In the x text field, type 0.4.
- 7 In the y text field, type 0.5.
- 8 In the z text field, type 0.5.
- 9 Locate the Axis section. From the Axis type list, choose Cartesian.
- 10 In the x text field, type 1.
- II In the z text field, type 0.
- 12 Click Build Selected.

Next, delete the segment of the cylinder that lies in the octant $y \le 0$, $z \ge 0$.

Delete Entities I (del1)

I In the Model Builder window, right-click Geometry I and choose Delete Entities.

2 Select the boundary shown in the figure below by clicking on it.

3 In the Settings window for Delete Entities, click Build Selected.

In order to facilitate applying materials and boundary conditions, create a selection of the electrode object.

Explicit Selection I (sell)

- I In the Geometry toolbar, click Selections and choose Explicit Selection.
- 2 In the Settings window for Explicit Selection, locate the Entities to Select section.
- 3 From the Geometric entity level list, choose Boundary.
- **4** In the **Graphics** window, click on the three boundaries constituting the electrode.
- 5 Right-click Explicit Selection I (sell) and choose Rename.
- 6 In the Rename Explicit Selection dialog box, type Electrode in the New label text field.
- 7 Click OK.

Finish the geometry by adding a block for the salt-water domain surrounding the electrode.

Block I (blk I)

- I In the Geometry toolbar, click Block.
- 2 In the Settings window for Block, click Build All Objects.
- 3 Click the **Zoom Extents** button in the **Graphics** toolbar.
- 4 Click the Wireframe Rendering button in the Graphics toolbar.

MATERIALS

Having created the geometry, proceed to assign materials.

ADD MATERIAL

- I In the Home toolbar, click Add Material to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Titanium beta-21S.
- 4 Click Add to Component in the window toolbar.
- 5 In the Home toolbar, click Add Material to close the Add Material window.

MATERIALS

Titanium beta-21S (mat1)

- I In the Settings window for Material, locate the Geometric Entity Selection section.
- 2 From the Geometric entity level list, choose Boundary.
- **3** From the **Selection** list, choose **Electrode**.

Material 2 (mat2)

- I In the Model Builder window, right-click Materials and choose Blank Material.
- 2 Right-click Material 2 (mat2) and choose Rename.
- 3 In the Rename Material dialog box, type Sea Water in the New label text field.
- 4 Click OK.
- **5** Select Domain 1 only.
- 6 In the Settings window for Material, locate the Material Contents section.
- **7** In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Electrical conductivity	sigma_iso; sigmaii = sigma_iso, sigmaij = 0	5	S/m	Basic
Relative permittivity	epsilonr_iso; epsilonrii = epsilonr_iso, epsilonrij = 0	85	I	Basic

ELECTRIC CURRENTS (EC)

Ground I

- I In the Model Builder window, under Component I (compl) right-click Electric Currents (ec) and choose Ground.
- 2 Select Boundary 3 only.

Electric Potential I

- I In the Physics toolbar, click Boundaries and choose Electric Potential.
- 2 Select Boundary 4 only.
- 3 In the Settings window for Electric Potential, locate the Electric Potential section.
- **4** In the V_0 text field, type 1.

Terminal I

- I In the Physics toolbar, click Boundaries and choose Terminal.
- 2 In the Settings window for Terminal, locate the Boundary Selection section.
- **3** From the **Selection** list, choose **Electrode**.

Next, apply an **Electric Shielding** node to the electrode for use in the second study. To prevent it from overriding the **Terminal** node just added, it will be excluded in the first study.

Electric Shielding I

- I In the Physics toolbar, click Boundaries and choose Electric Shielding.
- 2 In the Settings window for Electric Shielding, locate the Boundary Selection section.
- 3 From the Selection list, choose Electrode.
- **4** Locate the **Thickness** section. In the $d_{\rm s}$ text field, type 1[mm].

MESH I

Free Tetrahedral I

In the Model Builder window, under Component I (compl) right-click Mesh I and choose Free Tetrahedral.

Size

- I In the Settings window for Size, locate the Element Size section.
- 2 From the Predefined list, choose Fine.
- 3 Click Build All.

STUDY I

Before solving, disable the **Electric Shielding** node.

Step 1: Stationary

- I In the Model Builder window, under Study I click Step I: Stationary.
- 2 In the Settings window for Stationary, locate the Physics and Variables Selection section.
- 3 Select the Modify model configuration for study step check box.
- 4 In the Physics and variables selection tree, select Component I (compl)> Electric Currents (ec)>Electric Shielding I.
- 5 Click Disable.
- 6 In the Physics and variables selection tree, select Component I (compl).
- 7 In the Model Builder window, click Study 1.
- 8 In the Settings window for Study, locate the Study Settings section.
- **9** Clear the **Generate default plots** check box.

This setting is useful if you want full control over which plot groups to create.

10 In the **Home** toolbar, click **Compute**.

RESULTS

Before adding a **3D Plot Group** to use for reproducing the plot in Figure 1, add a selection to the solution data set to hide the block obstructing the view of the electrode.

I In the Model Builder window, expand the Results node.

Study I/Solution I (soll)

In the Model Builder window, expand the Results>Datasets node, then click Study 1/ Solution I (soll).

Selection

- I In the Results toolbar, click Attributes and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Boundary.
- 4 From the Selection list, choose Electrode.

Now create the plot.

3D Plot Group 1

I In the Results toolbar, click 3D Plot Group.

Change some settings in the color legends to better visualize the small variations in electric potential on the surface.

- 2 In the Settings window for 3D Plot Group, locate the Color Legend section.
- 3 Select the Show maximum and minimum values check box.
- 4 Click to expand the Number Format section. Select the Manual color legend settings check box.
- 5 In the Precision text field, type 4.

Slice 1

- I Right-click 3D Plot Group I and choose Slice.
- 2 In the Settings window for Slice, locate the Plane Data section.
- 3 In the Planes text field, type 1.

Surface I

- I In the Model Builder window, right-click 3D Plot Group I and choose Surface.
- 2 In the Settings window for Surface, locate the Coloring and Style section.
- 3 From the Color table list, choose GrayScale.

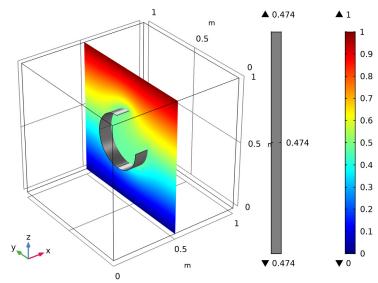

Note that the potential on the surface is constant.

3D Plot Group 1

I In the Model Builder window, click 3D Plot Group I.

2 In the 3D Plot Group I toolbar, click Plot.

This concludes the work on the terminal version of this application. Next, investigate how the results change as you introduce a finite conductivity and thickness to the plate. Add a separate study for this analysis.

ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies>Stationary.
- 4 Click Add Study in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

STUDY 2

Step 1: Stationary

Disable the **Terminal** node for this study, even though this is not strictly necessary as this node is overridden by the Electric Shielding node.

- I In the Settings window for Stationary, locate the Physics and Variables Selection section.
- 2 Select the Modify model configuration for study step check box.

- 3 In the Physics and variables selection tree, select Component I (compl)> Electric Currents (ec)>Terminal I.
- 4 Click Disable.
- 5 In the Physics and variables selection tree, select Component I (compl).
- 6 In the Model Builder window, click Study 2.
- 7 In the Settings window for Study, locate the Study Settings section.
- 8 Clear the Generate default plots check box.
- **9** In the **Home** toolbar, click **Compute**.

RESULTS

Add a selection, restricting this solution data set to the electrode as well.

Study 2/Solution 2 (sol2)

In the Model Builder window, under Results>Datasets click Study 2/Solution 2 (sol2).

Selection

- I In the Results toolbar, click Attributes and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Boundary.
- 4 From the Selection list, choose Electrode.

You may use the plot group you have already created as the starting point for plotting the new solution.

3D Plot Group 2

- I In the Model Builder window, under Results right-click 3D Plot Group I and choose Duplicate.
- 2 In the Settings window for 3D Plot Group, locate the Data section.
- 3 From the Dataset list, choose Study 2/Solution 2 (sol2).
- 4 In the 3D Plot Group 2 toolbar, click Plot.

The electric potential on the plate should now range from 0.472 V to 0.476 V.
