

Micromechanics and Stress Analysis of a Composite Cylinder

This model is licensed under the COMSOL Software License Agreement 5.6. All trademarks are the property of their respective owners. See www.comsol.com/trademarks.

Introduction

The use of fiber composites in the manufacturing industry is increasing. Compared to traditional metallic engineering materials, fiber composites are lighter and more corrosion resistant, and properties like strength, stiffness and toughness can often be tailored to a specific application. A fiber composite consists of load carrying fibers embedded in a polymer resin. The composite material is typically a laminate of individual layers, where the fibers in each layer are uni-directional. In this model, we perform a stress analysis of a laminated composite cylinder.

Modeling individual fibers in every layer in the laminate is unfeasible. A simplified micromechanics model of a single carbon fiber in epoxy is instead used to estimate the elastic properties of a single layer. These properties are then used in the homogenized model of the laminated composite cylinder. Two approaches are used to model the laminate, namely the Layerwise (LW) theory, and the Equivalent Single Layer (ESL) theory.

Model Definition

This model performs different types of analyses of a laminated composite cylinder. The model is divided into three parts:

- · Micromechanics analysis
- Stress analysis using the Layerwise theory
- Stress analysis using the Equivalent Single Layer theory

Eigenfrequencies and mode shapes are computed and compared using both theories.

MICROMECHANICS ANALYSIS

A micromechanics analysis of a single layer is performed in order to obtain its homogenized material properties. The composite layer is assumed to be made of carbon fibers unidirectionally embedded in epoxy resin. A representative unit cell having a cylindrical fiber located at the middle of resin is shown in Figure 1. The fiber radius is computed assuming a fiber volume fraction of **0.6**.

Figure 1: Geometry of the unit cell with a carbon fiber in an epoxy resin.

Fiber and Resin Properties

The layers of the laminate are made of T300 carbon fiber and 914C epoxy. The carbon fiber is assumed transversely isotropic (modeled as orthotropic), and the epoxy resin is assumed isotropic. The material properties of fiber and resin are given in Table 1 and Table 2, respectively.

| Material Property | Value |
|-----------------------------------|------------------------|
| $\{E_1, E_2, E_3\}$ | {230,15,15} GPa |
| $\{G_{12},G_{23},G_{13}\}$ | {15,7,15} GPa |
| $\{v_{12}, v_{23}, v_{13}\}$ | {0.2,0.07,0.2} |
| ρ | 1800 kg/m ³ |
| TABLE 2: EPOXY RESIN MATERIAL PRO | PERTIES. |
| Material Property | Value |
| E | 4 GPa |
| υ | 0.35 |
| ρ | 1100 kg/m ³ |

TABLE I: CARBON FIBER MATERIAL PROPERTIES.

Cell Periodicity

In order to perform a micromechanics analysis, the **Cell Periodicity** node in the **Solid Mechanics** interface is used. The **Cell Periodicity** node is used to apply periodic boundary conditions to the three pairs of faces of the unit cell.

In order to extract the homogenized elasticity matrix for a layer, the unit cell needs to be analyzed for six different load cases. The **Average Strain** periodicity type needs to be selected to obtain the homogenized elasticity matrix. This is automatically done with the help of the action buttons in the **Cell Periodicity** node. The **Cell Periodicity** node has two action buttons on the tool bar of section called **Periodicity Type**: **Create Load Groups and Study** and **Create Material**. The action button **Create Load Groups and Study** generates six different load groups and a stationary study with six load cases. The action button **Create Material** generates a **Global Material** with an elasticity matrix corresponding to that of the homogenized material. The generated global material can be used to define the properties of individual layers in a composite laminate.

STRESS ANALYSIS USING THE LAYERWISE THEORY

Layerwise (LW) Theory

In the Layerwise theory, the degrees of freedom are the displacements (u, v, w) available on the reference surface (or modeled surface) as well as in the through-thickness direction. From a constitutive equation point of view, this theory is similar to 3D solid elasticity. The layerwise theory is useful for detailed modeling of thick composite laminates because it can capture interlaminar shear stresses. It could therefore be used to also study delamination.

Geometry and Boundary Conditions

The model geometry of a composite cylinder with a length of 0.5 m and a radius of 0.1 m is shown in Figure 2. Boundary conditions and loading are:

- One end of the cylinder is fixed.
- The other end has a roller support.
- A load of 1 kN is applied to a quarter of the cylinder outer surface.

Figure 2: Geometry of the cylinder showing boundary conditions and loading.

Figure 3: Through-thickness view of the laminated material with five layers.

Stacking Sequence and Material Properties

The laminate consists of five layers of 1 mm thickness, as shown in Figure 3. The orientations of the layers are different. The orientations, starting from the bottom of the laminate, are taken as 0, 45, 90, -45, and 0 degrees, as shown in Figure 4. The orientation of a layer is specified with respect to the laminate coordinate system as shown in Figure 5. The material properties for each layer are given by the homogenized material computed in the micromechanics analysis.

The first principal material direction showing the fiber orientation in each layer of the physical geometry are shown in Figure 6 respectively.

Figure 4: Stacking sequence [0/45/90/-45/0] for the laminate showing the fiber orientation of each layer, from bottom to top.

Coordinate system surface: Boundary system

Figure 5: The laminate coordinate system showing the first principal direction along the cylinder axis.

Figure 6: First principal material direction showing the fiber orientation in each layer of the physical geometry. Ply angle is used as a color for each layer.

STRESS ANALYSIS USING THE ESL THEORY

Equivalent Single Layer (ESL) Theory

In the equivalent single layer (ESL) theory, the degrees of freedom are the displacements and rotations on the midplane of the laminate. From a constitutive equation point of view, this theory is similar to 3D shell elasticity. Through-thickness homogenized material properties of the laminate are used. It is therefore computationally less expensive than the layerwise theory. It can be used for the modeling of thin to moderately thick laminates with good accuracy. An aim of this analysis is to compare the results to the results obtained from the layerwise theory.

The model setup, including geometry, boundary conditions, material properties, and so on, is the same as described in the previous section.

Results and Discussion

In the micromechanics analysis, six load cases are used to evaluate the elasticity matrix. The distribution of effective (von Mises) stress for four of the load cases is shown in Figure 7.

Figure 7: Von Mises stress distribution in the unit cell for four load cases.

The von Mises stress distribution in the composite cylinder obtained from the two theories is presented in Figure 8. Both theories give similar results.

The through-thickness variation of the axial second Piola-Kirchhoff stress at a particular point on the cylinder is shown in Figure 9. We see that the stress variation is discontinuous between layers, but that the two theories predict similar distributions.

Figure 8: Von Mises stress distribution in the composite cylinder obtained using the Layerwise and ESL theories.

Figure 9: Through-thickness stress variation in the axial direction at a particular point on the cylinder.

10 | MICROMECHANICS AND STRESS ANALYSIS OF A COMPOSITE CYLINDER

Figure 10: Von Mises stress distribution in the five layers of the laminate.

Figure 10 shows the distribution of von Mises stress in each layer of the laminate using the **Layered Material Slice** plot. The distributions of stress in the individual layers are remarkably different. The middle layer, with fibers perpendicular to the first principal laminate direction, shows the lowest stresses.

The first six eigenfrequencies of the constrained cylinder are shown in Table 3, and the corresponding mode shapes are shown in Figure 11. The eigenfrequencies obtained using the LW and ESL theories match within 0.2%.

| Eigenfrequencies from layerwise theory (Hz) | Eigenfrequencies from ESL theory (Hz) |
|--|---------------------------------------|
| 486 | 485 |
| 573 | 572 |
| 984 | 984 |
| 999 | 999 |
| 1213 | 1211 |
| 1276 | 1274 |

Notes About the COMSOL Implementation

0.2

y , ,

• The micromechanics analysis of a single fiber in a resin can be performed using the **Cell Periodicity** node available in the **Solid Mechanics** interface. Using this functionality, the elasticity matrix of the homogenized material can be computed for the given fiber and resin properties, and the fiber volume fraction.

- The **Cell Periodicity** node has two action buttons on the tool bar of section called **Periodicity Type: Create Load Groups and Study** and **Create Material**. The action button **Create Load Groups and Study** generates load groups and a stationary study with loadcases. The action button **Create Material** generate a **Global Material** with homogenized material properties. The action buttons are active depending on the choices in the **Periodicity Type** and **Calculate Average Properties** lists.
- Modeling a composite laminated shell requires a surface geometry (2D), in general called a base surface, and a **Layered Material** node which adds an extra dimension (1D) to the base surface geometry in the surface normal direction. Using the **Layered Material** functionality, you can model several layers of different thickness, material properties, and fiber orientations. You can optionally specify the interface materials between the layers and the control mesh elements in each layer.
- The Layered Material Link and Layered Material Stack have an option to transform the given Layered Material into a symmetric or antisymmetric laminate. A repeated laminate can also be constructed using a transform option.
- You can either use the *Layerwise (LW)* theory based **Layered Shell** interface or the *Equivalent Single Layer (ESL)* theory based **Layered Linear Elastic Material** node in **Shell** interface.
- To analyze the results in a composite shell, you can either create a slice plot using the **Layered Material Slice** plot for in-plane variation of a quantity, or you can create a **Through Thickness** plot for out-of-plane variation of a quantity. To visualize the results as a 3D solid object, you can use the **Layered Material** dataset which creates a virtual 3D solid object combining the surface geometry (2D) and the extra dimension (1D).

Application Library path: Composite_Materials_Module/Tutorials/ composite_cylinder_micromechanics_and_stress_analysis

Modeling Instructions (Micromechanics)

From the File menu, choose New.

NEW

In the New window, click 🙅 Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click 间 3D.
- 2 In the Select Physics tree, select Structural Mechanics>Solid Mechanics (solid).
- 3 Click Add.
- 4 Click M Done.

GLOBAL DEFINITIONS

Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- 3 Click **b** Load from File.
- 4 Browse to the model's Application Libraries folder and double-click the file composite_cylinder_micromechanics_and_stress_analysis_parameters.txt.

GEOMETRY I

Block I (blk1)

- I In the **Geometry** toolbar, click 🗍 **Block**.
- 2 In the Settings window for Block, locate the Size and Shape section.
- **3** In the **Width** text field, type 1.
- **4** In the **Depth** text field, type 1.
- 5 In the **Height** text field, type 1.
- 6 Click 틤 Build Selected.

Cylinder I (cyl1)

- I In the **Geometry** toolbar, click 💭 **Cylinder**.
- 2 In the Settings window for Cylinder, locate the Size and Shape section.
- **3** In the **Radius** text field, type r_f.
- 4 In the **Height** text field, type 1.
- **5** Locate the **Position** section. In the **y** text field, type 1/2.
- **6** In the z text field, type 1/2.
- 7 Locate the Axis section. From the Axis type list, choose x-axis.
- 8 Click 틤 Build Selected.

Form Union (fin)

- I In the Model Builder window, click Form Union (fin).
- 2 In the Settings window for Form Union/Assembly, click 틤 Build Selected.

SOLID MECHANICS (SOLID)

Cell Periodicity 1

- In the Model Builder window, under Component I (comp1) right-click
 Solid Mechanics (solid) and choose the domain setting More>Cell Periodicity.
- 2 In the Settings window for Cell Periodicity, locate the Domain Selection section.
- **3** From the Selection list, choose All domains.
- 4 Locate the Periodicity Type section. From the list, choose Average strain.
- 5 From the Calculate average properties list, choose Elasticity matrix, Standard (XX, YY, ZZ, XY, YZ, XZ).

Boundary Pair I

- I In the Physics toolbar, click 📃 Attributes and choose Boundary Pair.
- 2 In the Settings window for Boundary Pair, locate the Boundary Selection section.
- 3 Click Clear Selection.
- 4 Select Boundaries 1, 5, 11, and 12 only.

Boundary Pair 2

- I Right-click Boundary Pair I and choose Duplicate.
- 2 In the Settings window for Boundary Pair, locate the Boundary Selection section.
- 3 Click Telear Selection.
- 4 Select Boundaries 2 and 10 only.

Boundary Pair 3

- I Right-click Boundary Pair 2 and choose Duplicate.
- 2 In the Settings window for Boundary Pair, locate the Boundary Selection section.
- 3 Click Clear Selection.
- **4** Select Boundaries **3** and **4** only.

In the upper-right corner of the Periodicity type section, you can find two buttons Create Load Groups and Study and Create Material. When the Average strain option is selected for computation of elasticity matrix, you can automatically generate load groups, a study, and a material by clicking on these buttons.

Cell Periodicity 1

- I In the Model Builder window, click Cell Periodicity I.
- 2 In the Settings window for Cell Periodicity, click Study and Material Generation in the upper-right corner of the Periodicity Type section. From the menu, choose Create Load Groups and Study to generate load groups and a study nodes.
- **3** Click **Study and Material Generation** in the upper-right corner of the **Periodicity Type** section. From the menu, choose **Create Material** to generate a global material node with computed elastic properties.

MATERIALS

Material I: Epoxy Resin

I In the Model Builder window, under Component I (comp1) right-click Materials and choose Blank Material.

Before adding the fiber material data, set the solid model to orthotropic in the **Linear Elastic Material** node since the fiber material is assumed to have orthotropic properties. The isotropic resin material data will be automatically converted into an orthotropic format.

- 2 In the **Settings** window for **Material**, type Material 1: Epoxy Resin in the **Label** text field.
- **3** Select Domain 1 only.
- 4 Locate the Material Contents section. In the table, enter the following settings:

| Property | Variable | Value | Unit | Property group |
|-----------------|----------|-------|-------|----------------|
| Young's modulus | E | E_r | Pa | Basic |
| Poisson's ratio | nu | nu_r | I | Basic |
| Density | rho | rho_r | kg/m³ | Basic |

SOLID MECHANICS (SOLID)

Linear Elastic Material I

- I In the Model Builder window, under Component I (comp1)>Solid Mechanics (solid) click Linear Elastic Material I.
- **2** In the **Settings** window for **Linear Elastic Material**, locate the **Linear Elastic Material** section.
- 3 From the Solid model list, choose Orthotropic.

MATERIALS

Material 2: Carbon Fiber

- I In the Model Builder window, under Component I (compl) right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Material 2: Carbon Fiber in the Label text field.
- 3 Locate the Geometric Entity Selection section. Click 📄 Paste Selection.
- 4 In the Paste Selection dialog box, type 2 in the Selection text field.
- 5 Click OK.
- 6 In the Settings window for Material, locate the Material Contents section.

| Property | Variable | Value | Unit | Property group |
|--------------------|---|------------------------------------|-------|----------------|
| Young's modulus | {Evector1, Evector2, Evector3} | {E1_f, E2_f, E2_f} | Pa | Orthotropic |
| Poisson's ratio | {nuvector1, nuvector2, nuvector3} | {nu12_f , nu23_f, nu12_f} | 1 | Orthotropic |
| Shear modulus | {Gvector1, Gvector2, Gvector3} | {G12_f, G23_f, G12_f} | N/m² | Orthotropic |
| Density | rho | rho_f | kg/m³ | Basic |

7 In the table, enter the following settings:

MESH I

Free Triangular 1

- I In the Mesh toolbar, click \bigwedge Boundary and choose Free Triangular.
- **2** Select Boundaries 1 and 5 only.
- 3 In the Settings window for Free Triangular, click 📗 Build Selected.

Swept I

- I In the Mesh toolbar, click 🎄 Swept.
- 2 In the Settings window for Swept, click 📗 Build Selected.

CELL PERIODICITY STUDY

In the **Home** toolbar, click **= Compute**.

RESULTS

Stress, Unit Cell

Use the following instructions to plot the von Mises stress in the unit cell as shown in Figure 7.

- I In the Settings window for 3D Plot Group, type Stress, Unit Cell in the Label text field.
- 2 In the Stress, Unit Cell toolbar, click 🗿 Plot.

Modeling Instructions (Stress Analysis using the Layerwise (LW) Theory)

This section describes how to model a laminated composite cylinder using the layerwise theory based **Layered Shell** interface.

ADD COMPONENT

In the Model Builder window, right-click the root node and choose Add Component>3D.

GEOMETRY 2

Cylinder I (cyl1)

- I In the Geometry toolbar, click 问 Cylinder.
- 2 In the Settings window for Cylinder, locate the Object Type section.
- 3 From the Type list, choose Surface.
- 4 Locate the Size and Shape section. In the Radius text field, type rc.
- 5 In the **Height** text field, type hc.
- 6 Locate the Axis section. From the Axis type list, choose x-axis.
- 7 Click 📄 Build Selected.

DEFINITIONS (COMP2)

Boundary System 2 (sys2)

- I In the Model Builder window, expand the Component 2 (comp2)>Definitions node, then click Boundary System 2 (sys2).
- 2 In the Settings window for Boundary System, locate the Settings section.
- 3 Find the Coordinate names subsection. From the Axis list, choose x.

ADD PHYSICS

I In the Home toolbar, click 🙀 Add Physics to open the Add Physics window.

- 2 Go to the Add Physics window.
- 3 In the tree, select Structural Mechanics>Layered Shell (Ishell).
- 4 Find the Physics interfaces in study subsection. In the table, clear the Solve check box for Cell Periodicity Study.
- 5 Click Add to Component 2 in the window toolbar.
- 6 In the Home toolbar, click 🖄 Add Physics to close the Add Physics window.

GLOBAL DEFINITIONS

The laminate is antisymmetric when the middle layer is excluded. Therefore, it is sufficient to define only a part of it in the **Layered Material** node. The transformation into the full laminate is performed through layered material settings in the **Layered Material Link** node.

Layered Material: [0/45/90/-45/0]

- I In the Model Builder window, under Global Definitions right-click Materials and choose Layered Material.
- 2 In the Settings window for Layered Material, type Layered Material: [0/45/90/-45/0] in the Label text field.

| | ayei | Deminition | section. | in the | tuble, e | ionowing | 5 setu | 1155. |
|---|------|------------|----------|--------|----------|----------|--------|-------|
| _ | | | | | | | | |

3 Locate the Laver Definition section. In the table enter the following settings:

| Layer | Material | Rotation (deg) | Thickness | Mesh elements |
|---------|---|-------------------|-----------|------------------|
| Layer 1 | Homogeneous Material (solidcp mat) | 0 | th | 1 |

4 Click Add two times.

5 In the table, enter the following settings:

| Layer | Material | Rotation (deg) | Thickness | Mesh elements |
|---------|---|-------------------|-----------|------------------|
| Layer 2 | Homogeneous Material (solidcp mat) | 45 | th | 1 |
| Layer 3 | Homogeneous Material (solidcp mat) | 90 | th | 1 |

MATERIALS

Layered Material Link 1 (Ilmat1)

I In the Model Builder window, under Component 2 (comp2) right-click Materials and choose Layers>Layered Material Link.

The laminate partially defined in the **Layered Material** node can be transformed into full laminate using a transform option in the layered material settings.

The middle layer is merged in order to create a five layer laminate.

- 2 In the Settings window for Layered Material Link, locate the Layered Material Settings section.
- **3** From the **Transform** list, choose **Antisymmetric**.
- 4 Select the Merge middle layers check box.
- 5 Click to expand the **Preview Plot Settings** section. In the **Thickness-to-width ratio** text field, type 0.4.
- 6 Locate the Layered Material Settings section. Click Layer Cross Section Preview in the upper-right corner of the section to enable the through-thickness view of the laminated material as in Figure 3.
- 7 Click Layer Stack Preview in the upper-right corner of the Layered Material Settings section to show the stacking sequence including the fiber orientation as in Figure 4.

GLOBAL DEFINITIONS

Homogeneous Material (solidcp1mat)

- I In the Model Builder window, under Global Definitions>Materials click Homogeneous Material (solidcp1mat).
- 2 In the Settings window for Material, locate the Material Contents section.
- **3** In the table, enter the following settings:

| Property | Variable | Value | Unit | Property group |
|----------|----------|-------|-------|----------------|
| Density | rho | rho_l | kg/m³ | Basic |

LAYERED SHELL (LSHELL)

Linear Elastic Material I

I In the Model Builder window, under Component 2 (comp2)>Layered Shell (Ishell) click Linear Elastic Material I.

- **2** In the Settings window for Linear Elastic Material, locate the Linear Elastic Material section.
- 3 From the Solid model list, choose Anisotropic.

Fixed Constraint I

I In the Physics toolbar, click 🗁 Edges and choose Fixed Constraint.

Use the following instructions to plot the von Mises stress in the cylinder as shown in Figure 8.

2 Select Edges 1, 2, 4, and 6 only.

Roller I

- I In the **Physics** toolbar, click 🔚 **Edges** and choose **Roller**.
- **2** Select Edges 9–12 only.

Body Load I

- I In the Physics toolbar, click 🔚 Boundaries and choose Body Load.
- **2** Select Boundary 2 only.
- 3 In the Settings window for Body Load, locate the Force section.
- 4 From the Load type list, choose Total force.
- **5** Specify the \mathbf{F}_{tot} vector as

| 0 | x |
|------|---|
| 0 | у |
| Ftot | z |

MESH 2

Mapped I

- I In the Mesh toolbar, click \bigwedge Boundary and choose Mapped.
- 2 In the Settings window for Mapped, locate the Boundary Selection section.
- 3 From the Selection list, choose All boundaries.

Distribution I

- I Right-click Mapped I and choose Distribution.
- 2 In the Settings window for Distribution, locate the Edge Selection section.
- 3 From the Selection list, choose All edges.
- 4 Locate the Distribution section. In the Number of elements text field, type 20.

5 Click 📗 Build All.

ADD STUDY

- I In the Home toolbar, click $\stackrel{\text{res}}{\longrightarrow}$ Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies>Stationary.
- 4 Find the Physics interfaces in study subsection. In the table, clear the Solve check box for Solid Mechanics (solid).
- 5 Click Add Study in the window toolbar.
- 6 In the Home toolbar, click 2 Add Study to close the Add Study window.

STUDY I: STATIONARY (LAYERWISE THEORY)

- I In the Model Builder window, click Study I.
- 2 In the **Settings** window for **Study**, type Study 1: Stationary (Layerwise Theory) in the **Label** text field.
- **3** In the **Home** toolbar, click **= Compute**.

RESULTS

Layered Material I

- I In the Model Builder window, expand the Results>Datasets node, then click Layered Material I.
- 2 In the Settings window for Layered Material, locate the Layers section.
- **3** In the **Scale** text field, type 5.

Cut Point 3D 1

- I In the Results toolbar, click 💽 Cut Point 3D.
- 2 In the Settings window for Cut Point 3D, locate the Data section.
- 3 From the Dataset list, choose Study 1: Stationary (Layerwise Theory)/ Solution 1a (3) (sol1).
- 4 Locate the Point Data section. In the X text field, type hc/2.
- 5 In the Y text field, type rc.
- 6 In the Z text field, type rc.
- 7 Select the Snap to closest boundary check box.

Stress (mises)

I In the Model Builder window, under Results click Stress (Ishell).

2 In the Settings window for 3D Plot Group, type Stress (mises) in the Label text field.

3 In the Stress (mises) toolbar, click **9** Plot.

Use the following instructions to plot the axial through-thickness stress variation at a particular point on the cylinder as shown in Figure 9.

Stress, Through Thickness (Slm I I)

- I In the Model Builder window, under Results click Stress, Through Thickness (Ishell).
- 2 In the Settings window for ID Plot Group, type Stress, Through Thickness (Slm11) in the Label text field.
- 3 Locate the Plot Settings section. Select the x-axis label check box.
- **4** In the associated text field, type Slm11 (MPa).

Through Thickness 1

- I In the Model Builder window, expand the Stress, Through Thickness (SIm11) node, then click Through Thickness 1.
- 2 In the Settings window for Through Thickness, locate the Data section.
- 3 From the Dataset list, choose Cut Point 3D I.
- 4 Locate the x-Axis Data section. In the Expression text field, type lshell.Slm11.
- 5 From the Unit list, choose MPa.
- 6 Click to expand the Legends section. From the Legends list, choose Manual.
- 7 In the table, enter the following settings:

Legends

Layerwise Theory

8 In the Stress, Through Thickness (SIm11) toolbar, click on Plot.

Use the following instructions to plot the von Mises stress in different layers of the cylinder as shown in Figure 10.

Stress, Slice (mises)

- I In the Model Builder window, expand the Results>Stress, Slice (Ishell) node, then click Stress, Slice (Ishell).
- 2 In the Settings window for 3D Plot Group, type Stress, Slice (mises) in the Label text field.
- **3** Locate the **Plot Settings** section. Clear the **Plot dataset edges** check box.

Layered Material Slice I

- I In the Model Builder window, click Layered Material Slice I.
- 2 In the Settings window for Layered Material Slice, locate the Through-Thickness Location section.
- 3 From the Location definition list, choose Layer midplanes.
- 4 Locate the Layout section. From the Displacement list, choose Rectangular.
- 5 From the Orientation list, choose zx.
- 6 In the **Relative x-separation** text field, type 0.3.
- 7 In the **Relative z-separation** text field, type 0.7.
- 8 Select the Show descriptions check box.
- 9 In the **Relative separation** text field, type 0.6.

IO Click to expand the **Range** section. Select the **Manual color range** check box.

- II In the Minimum text field, type 0.
- 12 In the Maximum text field, type 5e6.
- 13 Click to expand the Quality section. From the Resolution list, choose No refinement.

Deformation

- I In the Model Builder window, expand the Layered Material Slice I node.
- 2 Right-click Deformation and choose Disable.

Stress, Slice (mises)

- I In the Model Builder window, click Stress, Slice (mises).
- 2 In the Stress, Slice (mises) toolbar, click 🗿 Plot.

The laminate coordinate system and the thickness of the cylinder can be viewed in the automatically generated **Thickness and Orientation** plot.

Thickness and Orientation (Ishell)

- I Click the **Zoom Extents** button in the **Graphics** toolbar.
- 2 From the Home menu, choose Add Study.

ADD STUDY

- I Go to the Add Study window.
- 2 Find the Studies subsection. In the Select Study tree, select General Studies> Eigenfrequency.

- **3** Find the **Physics interfaces in study** subsection. In the table, clear the **Solve** check box for **Solid Mechanics (solid)**.
- 4 Click Add Study in the window toolbar.
- 5 From the Home menu, choose Add Study.

STUDY 2: EIGENFREQUENCY (LAYERWISE THEORY)

- I In the Model Builder window, expand the Results>Geometry and Layup (Ishell) node, then click Study 2.
- 2 In the Settings window for Study, type Study 2: Eigenfrequency (Layerwise Theory) in the Label text field.

Step 1: Eigenfrequency

- I In the Model Builder window, under Study 2: Eigenfrequency (Layerwise Theory) click Step I: Eigenfrequency.
- 2 In the Settings window for Eigenfrequency, locate the Study Settings section.
- **3** Select the **Desired number of eigenfrequencies** check box.
- **4** In the associated text field, type **12**.
- **5** In the **Home** toolbar, click **= Compute**.

Use the following instructions to plot mode shapes and eigenfrequencies as shown in Figure 11.

RESULTS

Mode Shape (Layerwise Theory)

- I In the **Settings** window for **3D Plot Group**, type Mode Shape (Layerwise Theory) in the **Label** text field.
- 2 Locate the Plot Settings section. From the View list, choose New view.
- **3** Click the \leftrightarrow **Zoom Extents** button in the **Graphics** toolbar.
- 4 In the Mode Shape (Layerwise Theory) toolbar, click 💽 Plot.

Modeling Instructions (Stress Analysis using the Equivalent Single Layer (ESL) Theory)

This section describes how to model a laminated composite cylinder using the equivalent single layer (ESL) theory based **Shell** interface.

GEOMETRY 2

In the Model Builder window, under Component 2 (comp2) click Geometry 2.

Move I (movI)

- I In the Geometry toolbar, click 💭 Transforms and choose Move.
- 2 Select the object cyll only.
- 3 In the Settings window for Move, locate the Input section.
- 4 Select the Keep input objects check box.
- 5 Locate the **Displacement** section. In the **y** text field, type hc.
- 6 Click 📄 Build Selected.

LAYERED SHELL (LSHELL)

- I In the Model Builder window, under Component 2 (comp2) click Layered Shell (Ishell).
- 2 In the Settings window for Layered Shell, locate the Boundary Selection section.
- 3 In the list, choose 5 (llmat1), 6 (llmat1), 7 (llmat1), and 8 (llmat1).
- 4 Click Remove from Selection.
- 5 Select Boundaries 1–4 only.

ADD PHYSICS

- I In the Home toolbar, click 🙀 Add Physics to open the Add Physics window.
- 2 Go to the Add Physics window.
- 3 In the tree, select Structural Mechanics>Shell (shell).
- 4 Find the Physics interfaces in study subsection. In the table, clear the Solve check boxes for Cell Periodicity Study, Study 1: Stationary (Layerwise Theory), and Study 2: Eigenfrequency (Layerwise Theory).
- 5 Click Add to Component 2 in the window toolbar.
- 6 In the Home toolbar, click 🙀 Add Physics to close the Add Physics window.

SHELL (SHELL)

- I Click the 🐱 Show More Options button in the Model Builder toolbar.
- 2 In the Show More Options dialog box, in the tree, select the check box for the node Physics>Advanced Physics Options.
- 3 Click OK.
- 4 In the Settings window for Shell, locate the Boundary Selection section.
- 5 In the list, choose 1, 2, 3, and 4.

- 6 Click Remove from Selection.
- 7 Select Boundaries 5–8 only.
- 8 Click to expand the Advanced Settings section. Clear the Use MITC interpolation check box.

Layered Linear Elastic Material I

- I Right-click Component 2 (comp2)>Shell (shell) and choose Material Models> Layered Linear Elastic Material.
- **2** In the **Settings** window for **Layered Linear Elastic Material**, locate the **Boundary Selection** section.
- **3** From the Selection list, choose All boundaries.
- 4 Locate the Linear Elastic Material section. From the Solid model list, choose Anisotropic.

Fixed Constraint I

- I In the Physics toolbar, click 🔚 Edges and choose Fixed Constraint.
- **2** Select Edges 9, 10, 12, and 14 only.

Symmetry 1

- I In the Physics toolbar, click 📄 Edges and choose Symmetry.
- **2** Select Edges 21–24 only.

Face Load I

- I In the Physics toolbar, click 🔚 Boundaries and choose Face Load.
- 2 Click the 🗤 Go to Default View button in the Graphics toolbar.
- **3** Select Boundary 6 only.
- 4 In the Settings window for Face Load, locate the Force section.
- 5 From the Load type list, choose Total force.
- **6** Specify the \mathbf{F}_{tot} vector as

| 0 | x |
|------|---|
| 0 | у |
| Ftot | z |

ADD STUDY

- I In the Home toolbar, click \sim Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies>Stationary.

- 4 Find the Physics interfaces in study subsection. In the table, clear the Solve check boxes for Solid Mechanics (solid) and Layered Shell (Ishell).
- 5 Click Add Study in the window toolbar.
- 6 In the Home toolbar, click 2 Add Study to close the Add Study window.

STUDY 3: STATIONARY (ESL THEORY)

- I In the Model Builder window, click Study 3.
- 2 In the Settings window for Study, type Study 3: Stationary (ESL Theory) in the Label text field.
- 3 Locate the Study Settings section. Clear the Generate default plots check box.
- **4** In the **Home** toolbar, click **= Compute**.

RESULTS

Layered Material 7

- I In the Model Builder window, under Results>Datasets right-click Layered Material I and choose Duplicate.
- 2 In the Settings window for Layered Material, locate the Data section.
- 3 From the Dataset list, choose Study 3: Stationary (ESL Theory)/Solution 3 (7) (sol3).

Cut Point 3D 2

- I In the Model Builder window, under Results>Datasets right-click Cut Point 3D I and choose Duplicate.
- 2 In the Settings window for Cut Point 3D, locate the Point Data section.
- **3** In the **Y** text field, type hc+rc.
- 4 Locate the Data section. From the Dataset list, choose Study 3: Stationary (ESL Theory)/ Solution 3 (7) (sol3).

Use the following instructions to plot the von Mises stress obtained using the ESL theory as shown in Figure 8.

Surface 2

- I In the Model Builder window, expand the Stress (mises) node.
- 2 Right-click Results>Stress (mises)>Surface I and choose Duplicate.
- 3 In the Settings window for Surface, locate the Expression section.
- 4 In the **Expression** text field, type shell.mises.
- 5 Locate the Data section. From the Dataset list, choose Layered Material 7.

- 6 Click to expand the Title section. From the Title type list, choose None.
- 7 Click to expand the Inherit Style section. From the Plot list, choose Surface I.

Deformation

- I In the Model Builder window, expand the Surface 2 node, then click Deformation.
- 2 In the Settings window for Deformation, locate the Expression section.
- **3** In the **x component** text field, type **u3**.
- **4** In the **y** component text field, type v3.
- 5 In the z component text field, type w3.

Stress (mises)

In the Model Builder window, click Stress (mises).

Table Annotation 1

- I In the Stress (mises) toolbar, click 间 More Plots and choose Table Annotation.
- 2 In the Settings window for Table Annotation, locate the Data section.
- 3 From the Source list, choose Local table.
- **4** In the table, enter the following settings:

| x-coordinate | y-coordinate | z-coordinate | Annotation |
|--------------|--------------|--------------|------------------|
| -2*hc/5 | 0 | 0 | Layerwise Theory |
| -2*hc/5 | hc | 0 | ESL Theory |

5 Locate the Coloring and Style section. Clear the Show point check box.

6 From the Anchor point list, choose Lower middle.

7 In the Stress (mises) toolbar, click **I** Plot.

Use the following instructions to plot the through-thickness stress variation as shown in Figure 9.

Through Thickness 2

- I In the Model Builder window, under Results>Stress, Through Thickness (SIm II) right-click Through Thickness I and choose Duplicate.
- 2 In the Settings window for Through Thickness, locate the Data section.
- 3 From the Dataset list, choose Cut Point 3D 2.
- 4 Locate the x-Axis Data section. In the Expression text field, type shell.Sl11.
- 5 Click to expand the Title section. From the Title type list, choose None.

- 6 Click to expand the Coloring and Style section. Find the Line style subsection. From the Line list, choose Dashed.
- 7 Locate the Legends section. In the table, enter the following settings:

Legends

ESL Theory

8 In the Stress, Through Thickness (SIm11) toolbar, click **O** Plot.

ADD STUDY

- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select General Studies> Eigenfrequency.
- **4** Find the **Physics interfaces in study** subsection. In the table, clear the **Solve** check boxes for **Solid Mechanics (solid)** and **Layered Shell (Ishell)**.
- 5 Click Add Study in the window toolbar.
- 6 In the Home toolbar, click \sim_{1}° Add Study to close the Add Study window.

STUDY 4: EIGENFREQUENCY (ESL THEORY)

- I In the Model Builder window, click Study 4.
- 2 In the Settings window for Study, type Study 4: Eigenfrequency (ESL Theory) in the Label text field.
- 3 Locate the Study Settings section. Clear the Generate default plots check box.

Step 1: Eigenfrequency

- I In the Model Builder window, under Study 4: Eigenfrequency (ESL Theory) click Step I: Eigenfrequency.
- 2 In the Settings window for Eigenfrequency, locate the Study Settings section.
- 3 Select the Desired number of eigenfrequencies check box.
- 4 In the associated text field, type 12.
- **5** In the **Home** toolbar, click **= Compute**.

RESULTS

Layered Material 8

- I In the Model Builder window, under Results>Datasets right-click Layered Material 4 and choose Duplicate.
- 2 In the Settings window for Layered Material, locate the Data section.
- 3 From the Dataset list, choose Study 4: Eigenfrequency (ESL Theory)/Solution 4 (9) (sol4).

Selection

- I Right-click Layered Material 8 and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- **3** From the Geometric entity level list, choose Boundary.
- 4 Select Boundaries 5–8 only.

Use the following instructions to plot mode shapes and eigenfrequencies obtained using the ESL theory.

Mode Shape (ESL Theory)

- I In the Model Builder window, right-click Mode Shape (Layerwise Theory) and choose Duplicate.
- 2 In the Settings window for 3D Plot Group, type Mode Shape (ESL Theory) in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose None.

Surface 1

- I In the Model Builder window, expand the Mode Shape (ESL Theory) node, then click Surface I.
- 2 In the Settings window for Surface, locate the Expression section.
- 3 In the **Expression** text field, type shell.disp.

Deformation

- I In the Model Builder window, expand the Surface I node, then click Deformation.
- 2 In the Settings window for Deformation, locate the Expression section.
- **3** In the **x component** text field, type **u3**.
- 4 In the y component text field, type v3.
- 5 In the z component text field, type w3.

Mode Shape (ESL Theory)

I In the Model Builder window, click Mode Shape (ESL Theory).

- 2 In the Settings window for 3D Plot Group, locate the Data section.
- 3 From the Dataset list, choose Layered Material 8.
- 4 From the Eigenfrequency (Hz) list, choose 1273.8.
- 5 Locate the Plot Settings section. From the View list, choose New view.
- 6 Click the 🕂 Zoom Extents button in the Graphics toolbar.
- 7 In the Mode Shape (ESL Theory) toolbar, click 💽 Plot.
