

# Stress and Modal Analysis of a Wind Turbine Composite Blade

This model is licensed under the COMSOL Software License Agreement 5.6. All trademarks are the property of their respective owners. See www.comsol.com/trademarks.

# Introduction

Wind turbines are an increasingly popular source of renewable energy. As such, the design, analysis and manufacture of wind turbines are important to the energy industry.

The turbine blades are critical components of a wind turbine. When generating electric power through rotation, they have to withstand different types of loads, such as wind, gravitational, and centrifugal loads. The sheer size of a blade necessitates light and strong materials, and composites are well suited for this.

This example shows how to analyze a composite wind turbine blade using a mixture of carbon-epoxy, glass-vinylester and PVC foam. The blade is constructed as a sandwich structure where the PVC foam core is sandwiched between carbon-epoxy and glass-vinylester.

First, a stress analysis of the blade is performed in which it is subjected to a combination of gravitational and centrifugal loads. The tip displacement, maximum stress values, and through-thickness stress distribution at a particular point on the blade are computed for different load cases. Second, a prestressed eigenfrequency analysis is performed for a range of operating speeds. A Campbell diagram depicting the variation of eigenfrequencies with rotation speed is generated.

## Model Definition

The geometry consists of a wind turbine blade of **61**.5 m length as shown in Figure 1. This is a blade geometry used in the NREL 5MW wind turbine (Ref. 1 and Ref. 2). The front and top views of the geometry are shown in Figure 2.

The blade geometry has 19 different sections, where each section is defined by an airfoil shape. The details of the type of airfoil together with the maximum chord and the twist in each section is given in Table 1.

Essentially there are six different types of airfoils which are used to build the full wind turbine blade as shown in Figure 3. Note that the NACA 64-618 is the best airfoil from aerodynamic point of view and hence used near the tip region whereas the DU 99-W-405 is good from a structural point of view and hence used near the root of the blade. In between there are other airfoils of DU family which are used for smooth transition between the two extreme airfoil shapes. More details about the DU family airfoils can be found in Ref. 3.

Figure 1: Geometry of a wind turbine blade for the NREL 5MW wind turbine. The different airfoils used at various sections are also shown.

.

Figure 2: Front view (zx-plane) and top view (xy-plane) of the wind turbine blade.

TABLE I: DIRECTIONAL INFORMATION OF WIND TURBINE BLADE GEOMETRY.

There are two important parts of a wind turbine blade:

- Skin
- Spars

The skin consists of the outer curved boundaries. It carries essentially the entire loading. In order to increase bending and torsional stiffness, the blade is reinforced using spars, which are internal vertical members.

Figure 3: Different types of airfoils used at various sections of the wind turbine blade.

#### LOADS AND BOUNDARY CONDITIONS

The left end of the blade is connected to the rotor hub, and it is fixed, as shown in Figure 4. The loads acting on the structure are the self-weight of the blade and the centrifugal force. The aerodynamic or wind loads are not considered.

Two types of analyses are performed:

- A Stationary analysis: This analysis is performed for the gravity load case, centrifugal force load case, and a combination of the gravity and centrifugal force load cases, for a single blade-RPM value (15 rpm).
- A Prestressed Eigenfrequency analysis: This analysis is performed for centrifugal load case for a range of blade RPMs (0–30 rpm).

10

Figure 4: The geometry showing boundary conditions and loads acting on the structure.

## LAMINA MATERIAL PROPERTIES

The analyzed wind turbine blade is a sandwich structure consisting of three different layered material types as shown in Figure 5.

The material properties of different laminae is taken from Ref. 4.

Figure 5: Sandwich arrangement of different layered materials used in the skin as well as in the spar of the blade.

## Carbon-Epoxy Laminate

The outer part of the sandwich structure is a carbon-epoxy laminate having 10 layers, each of thickness 0.28 mm and oriented at 0 degrees to the principal axis. The density of the lamina is taken as 1560 kg/m<sup>3</sup>. The orthotropic material properties of the lamina are given in Table 2.

| Material Property            | Value              |
|------------------------------|--------------------|
| $\{E_1, E_2, E_3\}$          | {139,9,9}(GPa)     |
| $\{G_{12}, G_{23}, G_{13}\}$ | {5.5,5.5,5.5}(GPa) |
| $\{v_{12}, v_{23}, v_{13}\}$ | {0.32,0.32,0.32}   |

TABLE 2: MATERIAL PROPERTIES OF CARBON-EPOXY MATERIAL.

## Glass-Vinylester Laminate

The next part of the sandwich structure is a glass-vinylester laminate. The density of this lamina is taken as  $1890 \text{ kg/m}^3$ . The orthotropic material properties are given in Table 3.

TABLE 3: MATERIAL PROPERTIES OF GLASS-VINYLESTER MATERIAL.

| Material Property            | Value              |
|------------------------------|--------------------|
| $\{E_1, E_2, E_3\}$          | {41,9,9}(GPa)      |
| $\{G_{12},G_{23},G_{13}\}$   | {4.1,4.1,4.1}(GPa) |
| $\{v_{12}, v_{23}, v_{13}\}$ | {0.3,0.3,0.3}      |

This laminate is made of 40 layers, each of 0.28 mm thickness with the stacking sequence shown in Table 4 and Figure 6.

| Layer Number | Fiber Orientation |
|--------------|-------------------|
| 1-5          | 0                 |
| 6-10         | 45                |
| 11-15        | - 45              |
| 16-20        | 90                |
| 21-25        | 90                |
| 26-30        | - 45              |
| 31-35        | 45                |
| 36-40        | 0                 |

TABLE 4: FIBER ORIENTATION IN GLASS-VINYLESTER LAYERED MATERIAL.

Figure 6: Stacking sequence of the glass-vinylester laminate, showing the fiber orientation in each layer, from bottom to top.

# PVC Foam

The core material of the sandwich structure is made of PVC Foam of thickness 15 cm. The density of the material is taken as  $200 \text{ kg/m}^3$ . The values of Young's modulus, shear modulus and Poisson's ratio for the material are taken as 250 MPa, 73 MPa, and 0.35, respectively.

## LAMINATE COORDINATE SYSTEM

The orientation of the laminate coordinate system in which the laminate material properties are specified is shown in Figure 7.

Load case: Gravity+Centrifugal Force Thickness and Orientation (shell)

Figure 7: The laminate coordinate system used to define material properties in the wind turbine blade.

## FINITE ELEMENT MESH

The structure is discretized using a mapped mesh, as shown in Figure 8.

Figure 8: The mapped mesh for the wind turbine blade.

Load case: Gravity+Centrifugal Force Surface: von Mises stress (N/m<sup>2</sup>)

▲ 2.48×10<sup>8</sup> ×10<sup>6</sup> 60 0.8 40 m 0.6 20 0.4 0 0.2 -1 0 m 1 0 2 0 -1 -2 -3 -4 ▼ -1.91×10<sup>7</sup>

Load case: Gravity+Centrifugal Force Surface: von Mises stress (N/m<sup>2</sup>)

Figure 10: The von Mises stress distribution in the spars for combined gravitational and centrifugal loads.

Figure 9 shows the distribution of von Mises stress in the skin and spars for a combined load case of gravitational and centrifugal forces. High stresses are present near the root of the blade and in the junction between the circular and airfoil cross sections. The stress distribution for the spars is shown separately in Figure 10. The stress distribution in the outermost carbon-epoxy laminate is shown in Figure 11 for the three load cases.

Figure 11: The von Mises stress distribution in the outermost carbon-epoxy layer for the three different load cases.

The through-thickness variation of von Mises stress at a particular point on the wind turbine blade is shown in Figure 12 for different load cases. Stress levels vary between laminates as well as between plies inside the different laminates. The highest stress levels can be seen in the carbon-epoxy that forms the outermost layer of the sandwich structure.

Figure 12: Through-thickness variation of von Mises stress for different load cases.

Figure 13: The fourth mode shape of the blade for different blade speeds.

Figure 14: First eight mode shapes of the blade when it is not rotating.

In the second part of the example, a prestressed eigenfrequency analysis is carried out to compute eigenfrequencies and corresponding mode shapes of the blade under centrifugal forces. Different mode shapes of the blade as well as the effect of centrifugal force on the mode shape are shown in Figure 14 and Figure 13.

A Campbell plot is created in order to understand the variation of eigenfrequencies with respect to the blade rotation speed as shown in Figure 15. The eigenfrequencies increase with an increase in the blade RPM. This is due to the centrifugal stiffening effect.

Figure 15: Campbell plot showing the variation of eigenfrequencies with an increase in the blade RPM.

Notes About the COMSOL Implementation

Modeling a composite laminated shell requires a surface geometry (2D), in general called a base surface, and a Layered Material node which adds an extra dimension (1D) to the base surface geometry in the surface normal direction. You can use the Layered Material functionality to model several layers stacked on top of each other having different thicknesses, material properties, and fiber orientations. You can optionally

specify the interface materials between the layers and control mesh elements in each layer.

• From a constitutive model point of view, you use the *equivalent single layer (ESL)* theory based formulation in **Layered Linear Elastic** material model of Shell interface.

## Modeling Instructions

From the File menu, choose New.

## NEW

In the New window, click Model Wizard.

## MODEL WIZARD

- I In the Model Wizard window, click 间 3D.
- 2 In the Select Physics tree, select Structural Mechanics>Shell (shell).
- 3 Click Add.
- 4 Click 🔿 Study.
- 5 In the Select Study tree, select General Studies>Stationary.
- 6 Click 🗹 Done.

#### **GLOBAL DEFINITIONS**

#### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.

**3** In the table, enter the following settings:

| Name  | Expression    | Value        | Description         |
|-------|---------------|--------------|---------------------|
| th    | 0.28[mm]      | 2.8E-4 m     | Layer thickness     |
| thc   | 15[cm]        | 0.15 m       | Core thickness      |
| RPM   | 15[rpm]       | 0.25 1/s     | Blade RPM           |
| omega | 2*pi[rad]*RPM | 1.5708 rad/s | Blade angular speed |

### GEOMETRY I

## Import I (imp1)

- I In the Model Builder window, expand the Component I (compl)>Geometry I node.
- 2 Right-click Geometry I and choose Import.
- 3 In the Settings window for Import, locate the Import section.
- 4 From the Source list, choose COMSOL Multiphysics file.
- 5 Click Browse.
- 6 Browse to the model's Application Libraries folder and double-click the file wind\_turbine\_composite\_blade.mphbin.
- 7 Click Import.

You can adjust the view of the geometry for better visualization.

## DEFINITIONS

### Skin Boundaries

- I In the **Definitions** toolbar, click **here Explicit**.
- 2 In the Settings window for Explicit, type Skin Boundaries in the Label text field.
- **3** Locate the **Input Entities** section. From the **Geometric entity level** list, choose **Boundary**.
- **4** Select Boundary 50 only.
- **5** Select the **Group by continuous tangent** check box.

#### Spar Boundaries

I In the Definitions toolbar, click 🐂 Explicit.

- 2 In the Settings window for Explicit, type Spar Boundaries in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- **4** Select Boundaries **3** and **5** only.
- **5** Select the **Group by continuous tangent** check box.

#### Fixed Edges

- I In the Definitions toolbar, click http://www.click.ic.
- 2 In the Settings window for Explicit, type Fixed Edges in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Edge.
- **4** Select Edge 10 only.
- 5 Select the Group by continuous tangent check box.

#### Average 1 (aveop1)

- I In the Definitions toolbar, click 🖉 Nonlocal Couplings and choose Average.
- 2 In the Settings window for Average, locate the Source Selection section.
- **3** From the **Geometric entity level** list, choose **Edge**.
- 4 From the Selection list, choose Fixed Edges.
- 5 Locate the Advanced section. From the Frame list, choose Material (X, Y, Z).

#### Boundary System 1 (sys1)

- I In the Model Builder window, click Boundary System I (sysI).
- 2 In the Settings window for Boundary System, locate the Settings section.
- 3 Find the Coordinate names subsection. From the Axis list, choose x.

#### Reverse Normal 1

- I Right-click Boundary System I (sysI) and choose Reverse Normal.
- 2 In the Settings window for Reverse Normal, locate the Boundary Selection section.
- 3 From the Selection list, choose Skin Boundaries.

#### GEOMETRY I

I Click the 🔚 Select Boundaries button in the Graphics toolbar.

2 Click the 🔌 Click and Hide button in the Graphics toolbar.

You can hide parts of the skin to visualize the spars inside the blade.

#### **GLOBAL DEFINITIONS**

Material: Carbon-Epoxy

- I In the Model Builder window, under Global Definitions right-click Materials and choose Blank Material.
- **2** In the **Settings** window for **Material**, type Material: Carbon-Epoxy in the **Label** text field.

Layered Material: CE-[0]\_10

- I Right-click Materials and choose Layered Material.
- 2 In the Settings window for Layered Material, type Layered Material: CE-[0]\_10 in the Label text field.
- **3** Locate the **Layer Definition** section. In the table, enter the following settings:

| Layer   | Material                          | Rotation (deg) | Thickness | Mesh elements |
|---------|-----------------------------------|----------------|-----------|---------------|
| Layer 1 | Material: Carbon-<br>Epoxy (matl) | 0.0            | th*10     | 1             |

Material: Glass-Vinylester

I Right-click Materials and choose Blank Material.

**2** In the **Settings** window for **Material**, type Material: Glass-Vinylester in the **Label** text field.

Layered Material: GV-[0\_5/45\_5/-45\_5/90\_5]\_s

- I Right-click Materials and choose Layered Material.
- 2 In the Settings window for Layered Material, type Layered Material: GV-[0\_5/45\_5/ -45\_5/90\_5]\_s in the Label text field.
- **3** Locate the Layer Definition section. In the table, enter the following settings:

| Layer   | Material                              | Rotation (deg) | Thickness | Mesh elements |
|---------|---------------------------------------|----------------|-----------|---------------|
| Layer 1 | Material: Glass-<br>Vinylester (mat2) | 0.0            | th*5      | 1             |

4 Click + Add.

Add six additional layers so that the material has a total of eight layers.

**5** In the table, enter the following settings:

| Layer   | Material                              | Rotation (deg) | Thickness | Mesh elements |
|---------|---------------------------------------|----------------|-----------|---------------|
| Layer 2 | Material: Glass-<br>Vinylester (mat2) | 45             | th*5      | 1             |
| Layer 3 | Material: Glass-<br>Vinylester (mat2) | - 45           | th*5      | 1             |
| Layer 4 | Material: Glass-<br>Vinylester (mat2) | 90             | th*5      | 1             |
| Layer 5 | Material: Glass-<br>Vinylester (mat2) | 90             | th*5      | 1             |
| Layer 6 | Material: Glass-<br>Vinylester (mat2) | - 45           | th*5      | 1             |
| Layer 7 | Material: Glass-<br>Vinylester (mat2) | 45             | th*5      | 1             |
| Layer 8 | Material: Glass-<br>Vinylester (mat2) | 0              | th*5      | 1             |

- 6 Click to expand the **Preview Plot Settings** section. In the **Thickness-to-width ratio** text field, type 0.6.
- 7 Locate the Layer Definition section. Click Layer Stack Preview in the upper-right corner of the section.

Material: PVC Foam

- I Right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Material: PVC Foam in the Label text field.

#### Layered Material: PF-[0]

- I Right-click Materials and choose Layered Material.
- 2 In the Settings window for Layered Material, type Layered Material: PF-[0] in the Label text field.
- 3 Locate the Layer Definition section. In the table, enter the following settings:

| Layer   | Material                     | Rotation (deg) | Thickness | Mesh elements |
|---------|------------------------------|----------------|-----------|---------------|
| Layer 1 | Material: PVC<br>Foam (mat3) | 0.0            | thc       | 1             |

#### MATERIALS

Create a **Layered Material Stack** in which the previously created layered materials can be arranged to finalize the sandwich structure of the composite.

#### Layered Material Stack 1 (stlmat1)

In the Model Builder window, under Component I (compl) right-click Materials and choose Layers>Layered Material Stack.

#### Layered Material Link: Carbon-Epoxy

In the **Settings** window for **Layered Material Link**, type Layered Material Link: Carbon-Epoxy in the **Label** text field.

#### Layered Material Link: Glass-Vinylester

- I Right-click Layered Material Link: Carbon-Epoxy and choose Duplicate.
- 2 In the Settings window for Layered Material Link, type Layered Material Link: Glass-Vinylester in the Label text field.
- 3 Locate the Link Settings section. From the Material list, choose Layered Material: GV-[0\_5/ 45\_5/-45\_5/90\_5]\_s (lmat2).

## Layered Material Link: PVC Foam

- I Right-click Layered Material Link: Glass-Vinylester and choose Duplicate.
- 2 In the Settings window for Layered Material Link, type Layered Material Link: PVC Foam in the Label text field.
- 3 Locate the Link Settings section. From the Material list, choose Layered Material: PF-[0] (Imat3).

### Layered Material Link: Glass-Vinylester 1 (stlmat1.stllmat4)

In the Model Builder window, under Component I (compl)>Materials> Layered Material Stack I (stImat1) right-click Layered Material Link: Glass-Vinylester (stImat1.stIlmat2) and choose Duplicate.

#### Layered Material Link: Carbon-Epoxy 1 (stlmat1.stllmat5)

In the Model Builder window, under Component I (comp1)>Materials> Layered Material Stack I (stImat1) right-click Layered Material Link: Carbon-Epoxy (stImat1.stIlmat1) and choose Duplicate.

#### Layered Material Stack 1 (stlmat1)

- I In the Settings window for Layered Material Stack, click to expand the Preview Plot Settings section.
- 2 Clear the Shows labels in cross-section plot check box.
- **3** Locate the **Layered Material Settings** section. Click **Layer Cross Section Preview** in the upper-right corner of the section.

#### SHELL (SHELL)

Layered Linear Elastic Material I

- I In the Model Builder window, under Component I (compl) right-click Shell (shell) and choose Material Models>Layered Linear Elastic Material.
- **2** In the **Settings** window for **Layered Linear Elastic Material**, locate the **Boundary Selection** section.
- 3 From the Selection list, choose All boundaries.
- 4 Locate the Linear Elastic Material section. From the Solid model list, choose Orthotropic.

Add the material properties of carbon-epoxy, glass-vinylester and PVC foam.

## **GLOBAL DEFINITIONS**

Material: Carbon-Epoxy (mat1)

- I In the Model Builder window, under Global Definitions>Materials click Material: Carbon-Epoxy (matl).
- 2 In the Settings window for Material, locate the Material Contents section.

| Property           | Variable                                | Value                       | Unit  | Property group |
|--------------------|---|-----------------------------|-------|----------------|
| Young's<br>modulus | {Evector1,<br>Evector2,<br>Evector3}    | {139e9,<br>9e9,<br>9e9}     | Pa    | Orthotropic    |
| Poisson's<br>ratio | {nuvector1,<br>nuvector2,<br>nuvector3} | {0.32,<br>0.32,<br>0.32}    | 1     | Orthotropic    |
| Shear<br>modulus   | {Gvector1,<br>Gvector2,<br>Gvector3}    | {5.5e9,<br>5.5e9,<br>5.5e9} | N/m²  | Orthotropic    |
| Density            | rho                                     | 1560                        | kg/m³ | Basic          |

**3** In the table, enter the following settings:

Material: Glass-Vinylester (mat2)

I In the Model Builder window, click Material: Glass-Vinylester (mat2).

2 In the Settings window for Material, locate the Material Contents section.

**3** In the table, enter the following settings:

| Property           | Variable                                | Value                       | Unit  | Property group |
|--------------------|---|-----------------------------|-------|----------------|
| Young's<br>modulus | {Evector1,<br>Evector2,<br>Evector3}    | {41e9,<br>9e9,<br>9e9}      | Pa    | Orthotropic    |

Material: PVC Foam (mat3)

I In the Model Builder window, click Material: PVC Foam (mat3).

2 In the Settings window for Material, locate the Material Contents section.

| Property           | Variable                                | Value                       | Unit  | Property group |
|--------------------|---|-----------------------------|-------|----------------|
| Young's<br>modulus | {Evector1,<br>Evector2,<br>Evector3}    | {250e6,<br>250e6,<br>250e6} | Pa    | Orthotropic    |
| Poisson's<br>ratio | {nuvector1,<br>nuvector2,<br>nuvector3} | {0.35,<br>0.35,<br>0.35}    | I     | Orthotropic    |
| Shear<br>modulus   | {Gvector1,<br>Gvector2,<br>Gvector3}    | {73e6,<br>73e6,<br>73e6}    | N/m²  | Orthotropic    |
| Density            | rho                                     | 200                         | kg/m³ | Basic          |

**3** In the table, enter the following settings:

- 4 Click the 🐱 Show More Options button in the Model Builder toolbar.
- 5 In the Show More Options dialog box, in the tree, select the check box for the node Physics>Advanced Physics Options.
- 6 Click OK.

## SHELL (SHELL)

Layered Linear Elastic Material I

- I In the Model Builder window, under Component I (compl)>Shell (shell) click Layered Linear Elastic Material I.
- 2 In the Settings window for Layered Linear Elastic Material, click to expand the Shear Correction Factor section.
- 3 From the list, choose User defined.

## Fixed Constraint I

- I In the Physics toolbar, click 🗁 Edges and choose Fixed Constraint.
- 2 In the Settings window for Fixed Constraint, locate the Edge Selection section.
- **3** From the Selection list, choose Fixed Edges.

#### Gravity I

- I In the Physics toolbar, click 📄 Boundaries and choose Gravity.
- 2 In the Settings window for Gravity, locate the Boundary Selection section.
- 3 From the Selection list, choose All boundaries.
- 4 In the Physics toolbar, click 🙀 Load Group and choose New Load Group.

#### **GLOBAL DEFINITIONS**

Load Group: Gravity

- I In the Model Builder window, under Global Definitions>Load and Constraint Groups click Load Group I.
- 2 In the Settings window for Load Group, type Load Group: Gravity in the Label text field.

## SHELL (SHELL)

Rotating Frame 1

- I In the Physics toolbar, click 📄 Boundaries and choose Rotating Frame.
- 2 In the Settings window for Rotating Frame, locate the Boundary Selection section.
- 3 From the Selection list, choose All boundaries.
- 4 Locate the Rotating Frame section. From the Axis of rotation list, choose User defined. Specify the  ${\bf r}_{\rm bp}$  vector as

| aveop1(X) | x |
|-----------|---|
| aveop1(Y) | у |
| aveop1(Z) | z |

**5** Specify the  $\mathbf{e}_{ax}$  vector as

| 0 | x |
|---|---|
| 1 | v |

0 z

- 6 From the Rotational direction list, choose Clockwise.
- **7** In the  $\Omega$  text field, type omega.
- 8 Locate the Frame Acceleration Effect section. Clear the Spin softening check box.
- 9 In the Physics toolbar, click 🙀 Load Group and choose New Load Group.

## GLOBAL DEFINITIONS

Load Group: Centrifugal Force

- I In the Model Builder window, under Global Definitions>Load and Constraint Groups click Load Group 2.
- 2 In the Settings window for Load Group, type Load Group: Centrifugal Force in the Label text field.

#### MESH I

#### Mapped I

- I In the Mesh toolbar, click  $\bigwedge$  Boundary and choose Mapped.
- 2 In the Settings window for Mapped, locate the Boundary Selection section.
- 3 From the Selection list, choose All boundaries.

## Size I

- I Right-click Mapped I and choose Size.
- 2 In the Settings window for Size, click to expand the Element Size Parameters section.
- 3 Locate the Element Size section. Click the Custom button.
- 4 Locate the Element Size Parameters section. Select the Maximum element size check box.
- **5** In the associated text field, type **0.5**.
- 6 In the Model Builder window, right-click Mesh I and choose Build All.

## STUDY: STATIC

- I In the Model Builder window, click Study I.
- 2 In the Settings window for Study, type Study: Static in the Label text field.

#### Step 1: Stationary

- I In the Model Builder window, under Study: Static click Step I: Stationary.
- 2 In the Settings window for Stationary, click to expand the Study Extensions section.
- **3** Select the **Define load cases** check box.
- 4 Click + Add.

Add two additional load cases.

**5** In the table, enter the following settings:

| Load case                               | lgl          | Weight | lg2          | Weight |
|---|--------------|--------|--------------|--------|
| Load case: Gravity                      |              | 1.0    |              | 1.0    |
| Load case: Centrifugal Force            |              | 1.0    |              | 1.0    |
| Load case: Gravity+Centrifugal<br>Force | $\checkmark$ | 1.0    | $\checkmark$ | 1.0    |

6 In the Home toolbar, click **=** Compute.

### RESULTS

Layered Materials

In the Model Builder window, expand the Results>Datasets node.

#### Layered Material 2 (Shell Geometry)

- I In the Model Builder window, expand the Layered Materials node, then click Layered Material 2 (Shell Geometry).
- 2 In the Settings window for Layered Material, locate the Layers section.
- 3 In the Scale text field, type 1.

#### Layered Material 3 (Material Direction)

- I In the Model Builder window, click Layered Material 3 (Material Direction).
- 2 In the Settings window for Layered Material, locate the Layers section.
- **3** In the **Scale** text field, type **1**.

#### Layered Material 4

In the Model Builder window, under Results>Datasets right-click Layered Material I and choose Duplicate.

Selection

- I In the Results toolbar, click 🐐 Attributes and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- **3** From the Geometric entity level list, choose Boundary.
- 4 From the Selection list, choose Spar Boundaries.

#### Tip Displacement

- I In the Results toolbar, click <sup>8.85</sup><sub>e-12</sub> Point Evaluation.
- 2 In the Settings window for Point Evaluation, type Tip Displacement in the Label text field.
- **3** Select Point 110 only.
- **4** Locate the **Expressions** section. In the table, enter the following settings:

| Expression | Unit | Description            |
|------------|------|------------------------|
| shell.disp | m    | Displacement magnitude |

5 Click **=** Evaluate.

#### Maximum Stress

- I In the Results toolbar, click <sup>8.85</sup><sub>e-12</sub> More Derived Values and choose Maximum> Volume Maximum.
- 2 In the Settings window for Volume Maximum, type Maximum Stress in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Layered Material I.
- 4 Locate the **Expressions** section. In the table, enter the following settings:

| Expression  | Unit | Description      |
|-------------|------|------------------|
| shell.mises | MPa  | von Mises stress |

## 5 Click **=** Evaluate.

Use the following instructions to plot the von Mises stress distribution on the skin and spar boundaries of the blade as shown in Figure 9.

#### Stress: Skin+Spar

- I In the Model Builder window, under Results click Stress (shell).
- 2 In the Settings window for 3D Plot Group, type Stress: Skin+Spar in the Label text field.
- 3 Locate the Plot Settings section. From the View list, choose New view.
- **4** Locate the **Color Legend** section. Select the **Show maximum and minimum values** check box.

#### Surface 1

- I In the Model Builder window, expand the Stress: Skin+Spar node, then click Surface I.
- 2 In the Settings window for Surface, click to expand the Range section.
- **3** Select the Manual color range check box.
- 4 In the Maximum text field, type 1e8.
- 5 In the Stress: Skin+Spar toolbar, click 💽 Plot.

Use the following instructions to plot the von Mises stress distribution on the spar boundaries as shown in Figure 10.

#### Stress: Spar

- I In the Model Builder window, right-click Stress: Skin+Spar and choose Duplicate.
- 2 In the Settings window for 3D Plot Group, type Stress: Spar in the Label text field.
- 3 Locate the Plot Settings section. From the View list, choose Automatic.

#### Surface 1

- I In the Model Builder window, expand the Stress: Spar node, then click Surface I.
- 2 In the Settings window for Surface, locate the Data section.
- 3 From the Dataset list, choose Layered Material 4.
- 4 In the Stress: Spar toolbar, click **I** Plot.

Use the following instructions to plot the von Mises stress distribution on the layered material slice as shown in Figure 11.

#### Stress, Slice (Carbon-Epoxy)

- I In the Model Builder window, under Results click Stress, Slice (shell).
- 2 In the Settings window for 3D Plot Group, type Stress, Slice (Carbon-Epoxy) in the Label text field.
- 3 In the Model Builder window, expand the Stress, Slice (Carbon-Epoxy) node.

Layered Material Slice I

- I In the Model Builder window, expand the Results>Stress, Slice (Carbon-Epoxy)> Layered Material Slice I node, then click Layered Material Slice I.
- 2 In the Settings window for Layered Material Slice, click to expand the Range section.
- **3** Locate the **Through-Thickness Location** section. In the **Local z-coordinate [-1,1]** text field, type **1**.
- **4** Locate the **Range** section. Select the **Manual color range** check box.
- 5 In the Maximum text field, type 1e8.
- 6 In the Stress, Slice (Carbon-Epoxy) toolbar, click 🗿 Plot.

Use the following instructions to plot the von Mises stress distribution on different layered material slices.

## Stress, Slice

- I Right-click Layered Material Slice I and choose Duplicate.
- 2 In the Settings window for 3D Plot Group, type Stress, Slice in the Label text field.
- 3 Locate the Plot Settings section. Clear the Plot dataset edges check box.
- 4 From the View list, choose New view.

## Layered Material Slice 1

I In the Model Builder window, expand the Stress, Slice node, then click Layered Material Slice I.

- **2** In the Settings window for Layered Material Slice, locate the Through-Thickness Location section.
- **3** From the Location definition list, choose Physical.
- 4 In the Local z-coordinate text field, type 5\*th, 17\*th, 30\*th, 50\*th+0.5\*thc, 70\* th+thc, 83\*th+thc, 95\*th+thc.
- 5 Locate the Layout section. From the Displacement list, choose Linear.
- 6 In the Relative z-separation text field, type 0.3.
- 7 Select the **Show descriptions** check box.
- 8 In the Relative separation text field, type 0.35.

Table Annotation 1

- I In the Model Builder window, right-click Stress, Slice and choose Table Annotation.
- 2 In the Settings window for Table Annotation, locate the Data section.
- **3** From the **Source** list, choose **Local table**.
- **4** In the table, enter the following settings:

| x-coordinate | y-coordinate | z-coordinate | Annotation       |
|--------------|--------------|--------------|------------------|
| 80           | 0            | 0            | Carbon-Epoxy     |
| 80           | 0            | 18           | Glass-Vinylester |
| 80           | 0            | 37.5         | Glass-Vinylester |
| 80           | 0            | 56           | PVC-Foam         |
| 80           | 0            | 76           | Glass-Vinylester |
| 80           | 0            | 94           | Glass-Vinylester |
| 80           | 0            | 112          | Carbon-Epoxy     |

5 Locate the Coloring and Style section. Clear the Show point check box.

6 From the Orientation list, choose Vertical.

Stress, Slice

- I In the Model Builder window, click Stress, Slice.
- 2 In the Stress, Slice toolbar, click 💽 Plot.

Use the following instructions to plot the through-thickness variation of von Mises stress for different load cases as shown in Figure 12.

Stress, Through Thickness (shell)

- I In the Model Builder window, click Stress, Through Thickness (shell).
- 2 In the Settings window for ID Plot Group, locate the Data section.

- 3 From the Parameter selection (Load case) list, choose All.
- 4 Locate the Plot Settings section. Select the x-axis label check box.
- **5** In the associated text field, type von Mises stress (MPa).
- 6 Select the y-axis label check box.
- 7 In the associated text field, type Thickness coordinate (mm).
- 8 Locate the Axis section. Select the Manual axis limits check box.
- **9** In the **x minimum** text field, type **0**.
- **IO** In the **x maximum** text field, type 100.
- II In the **y minimum** text field, type 0.
- **12** In the **y maximum** text field, type 60\*1000\*th.

13 Locate the Legend section. From the Position list, choose Middle right.

Through Thickness 1

- I In the Model Builder window, expand the Stress, Through Thickness (shell) node, then click Through Thickness I.
- 2 In the Settings window for Through Thickness, locate the Selection section.
- **3** Click **Clear Selection**.
- **4** Select Point 26 only.
- 5 Locate the x-Axis Data section. From the Unit list, choose MPa.
- 6 Locate the y-Axis Data section. From the Parameter list, choose Expression.
- 7 In the **Expression** text field, type shell.xd.
- 8 From the **Unit** list, choose **mm**.
- **9** Find the Interface positions subsection. From the Show interface positions list, choose Interfaces between layered materials.
- **10** Click to expand the **Coloring and Style** section. Find the **Line style** subsection. From the **Line** list, choose **Cycle**.
- II Click to expand the Legends section. From the Legends list, choose Manual.
- **12** In the table, enter the following settings:

Legends

Gravity

Centrifugal Force

Gravity+Centrifugal Force

## Stress, Through Thickness (shell)

In the Model Builder window, click Stress, Through Thickness (shell).

#### Table Annotation 1

- I In the Stress, Through Thickness (shell) toolbar, click  $\sim$  More Plots and choose Table Annotation.
- 2 In the Settings window for Table Annotation, locate the Data section.
- 3 From the Source list, choose Local table.
- **4** In the table, enter the following settings:

| x-coordinate | y-coordinate | Annotation       |
|--------------|--------------|------------------|
| 30           | 5*1000*th    | Carbon-Epoxy     |
| 30           | 30*1000*th   | Glass-Vinylester |
| 30           | 55*1000*th   | PVC-Foam         |

5 Locate the Coloring and Style section. Clear the Show point check box.

6 In the Stress, Through Thickness (shell) toolbar, click 🗿 Plot.

#### Shell Geometry (shell)

- I In the Model Builder window, click Shell Geometry (shell).
- 2 In the Shell Geometry (shell) toolbar, click 💽 Plot.

Use the following instructions to plot the layered material coordinate system as shown in Figure 7.

#### Thickness and Orientation (shell)

- I In the Model Builder window, click Thickness and Orientation (shell).
- 2 In the Settings window for 3D Plot Group, locate the Plot Settings section.
- 3 From the View list, choose View 3D 3.

## Thickness

- I In the Model Builder window, expand the Thickness and Orientation (shell) node.
- 2 Right-click Thickness and choose Disable.

#### Surface 1

- I In the Model Builder window, right-click Thickness and Orientation (shell) and choose Surface.
- 2 In the Settings window for Surface, locate the Coloring and Style section.
- 3 From the Coloring list, choose Uniform.

4 From the Color list, choose Gray.

5 In the Thickness and Orientation (shell) toolbar, click on Plot.

Now you can add an Eigenfrequency, Prestressed study.

## ADD STUDY

- I In the Home toolbar, click 2 Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select Preset Studies for Selected Physics Interfaces>Eigenfrequency, Prestressed.
- 4 Click Add Study in the window toolbar.
- 5 In the Home toolbar, click  $\sim 2$  Add Study to close the Add Study window.

## STUDY: EIGENFREQUENCY

- I In the Model Builder window, click Study 2.
- 2 In the Settings window for Study, type Study: Eigenfrequency in the Label text field.

You can perform a parametric sweep for a range of blade RPMs, from 0 to 30 rpm.

#### Parametric Sweep

- I In the Study toolbar, click **Parametric Sweep**.
- 2 In the Settings window for Parametric Sweep, locate the Study Settings section.
- 3 Click + Add.
- 4 In the table, enter the following settings:

| Parameter name  | Parameter value list | Parameter unit |
|-----------------|----------------------|----------------|
| RPM (Blade RPM) | range(0,5,30)[rpm]   | 1/s            |

Step 1: Stationary

- I In the Model Builder window, click Step I: Stationary.
- 2 In the Settings window for Stationary, locate the Study Extensions section.
- **3** Select the **Define load cases** check box.
- 4 Click + Add.
- **5** In the table, enter the following settings:

| Load case                    | lgl | Weight | lg2 | Weight |
|------------------------------|-----|--------|-----|--------|
| Load Case: Centrifugal Force |     | 1.0    |     | 1.0    |

### Step 2: Eigenfrequency

- I In the Model Builder window, click Step 2: Eigenfrequency.
- 2 In the Settings window for Eigenfrequency, locate the Study Settings section.
- **3** Select the **Desired number of eigenfrequencies** check box.
- 4 In the associated text field, type 8.
- 5 From the Eigenfrequency search method around shift list, choose Larger real part.
- 6 In the Study toolbar, click **=** Compute.

## RESULTS

Layered Material 6 (Shell Geometry)

- I In the Model Builder window, expand the Layered Materials I node, then click Layered Material 6 (Shell Geometry).
- 2 In the Settings window for Layered Material, locate the Layers section.
- **3** In the **Scale** text field, type 1.

Layered Material 7 (Material Direction)

- I In the Model Builder window, click Layered Material 7 (Material Direction).
- 2 In the Settings window for Layered Material, locate the Layers section.
- 3 In the Scale text field, type 1.

Use the following instructions to plot the mode shapes for different RPMs as shown in Figure 13.

Mode Shape (shell)

- I In the Model Builder window, click Mode Shape (shell).
- 2 In the Settings window for 3D Plot Group, locate the Data section.
- 3 From the Eigenfrequency (Hz) list, choose 4.9487.
- 4 From the Parameter value (RPM (1/s)) list, choose 0.
- **5** Click the **XY** Go to XY View button in the Graphics toolbar.
- 6 Click the E Show Grid button in the Graphics toolbar.
- 7 In the Mode Shape (shell) toolbar, click 🗿 Plot.

Use the following instructions to plot the mode shapes for different RPMs as shown in Figure 15.

Campbell Diagram

I In the Home toolbar, click 🚛 Add Plot Group and choose ID Plot Group.

- 2 In the Settings window for ID Plot Group, type Campbell Diagram in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study: Eigenfrequency/ Parametric Solutions I (sol4).
- 4 Click to expand the **Title** section. From the **Title type** list, choose **Label**.
- 5 Locate the Plot Settings section. Select the y-axis label check box.
- 6 In the associated text field, type Frequency (Hz).
- 7 Locate the Legend section. Clear the Show legends check box.

## Global I

- I Right-click Campbell Diagram and choose Global.
- 2 In the Settings window for Global, locate the y-Axis Data section.
- **3** In the table, enter the following settings:

| Expression | Unit | Description |
|------------|------|-------------|
| freq       | 1/s  | Frequency   |

- 4 Locate the x-Axis Data section. From the Axis source data list, choose Outer solutions.
- 5 Click to expand the **Coloring and Style** section. Find the **Line style** subsection. From the **Line** list, choose **Cycle**.
- 6 Find the Line markers subsection. From the Marker list, choose Cycle.
- 7 From the **Positioning** list, choose **In data points**.

#### Animation I

- I In the **Results** toolbar, click **Animation** and choose **Player**.
- 2 In the Settings window for Animation, locate the Scene section.
- 3 From the Subject list, choose Mode Shape (shell).
- 4 Locate the Animation Editing section. From the Sequence type list, choose Dynamic data extension.
- 5 Locate the Frames section. In the Frame number text field, type 25.
- 6 Right-click Animation I and choose Play.
