

Viscoelastic Structural Damper

The example studies a forced response of a typical viscoelastic damper. Damping elements involving layers of viscoelastic materials are often used for reduction of seismic and wind induced vibrations in buildings and other tall structures. The common feature is that the frequency of the forced vibrations is low.

Model Definition

The geometry of the viscoelastic damper is shown in Figure 1 (from Ref. 1). The damper consists of two layers of viscoelastic material confined between mounting elements made of steel.

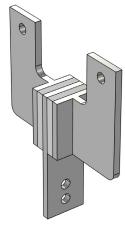

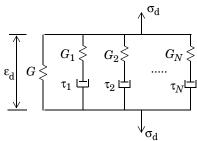

Figure 1: Viscoelastic damping element.

The viscoelastic layers are modeled with the generalized Maxwell model available in COMSOL Multiphysics. The generalized Maxwell model represents the viscoelastic material as a series of branches, each with a spring-dashpot pair.

Eighteen viscoelastic branches guarantee accurate representation of the material behavior for a wide range of excitation frequencies, when the damper is subjected to forced vibration. The values of the shear moduli and relaxation times for each branch are available in Ref. 1. They are summarized in the following table:

TABLE I: MODEL DATA FOR THE VISCOELASTIC DAMPER MODEL.

PROPERTY	VALUE	DESCRIPTION
G	58.6 kPa	Long time shear modulus
ρ	1.06 g/cm ³	Density
G_1	13.3 MPa	Shear modulus, branch I
τ_1	10 ⁻⁷ s	Relaxation time, branch I
G_2	286 MPa	Shear modulus, branch 2
τ_2	10 ⁻⁶ s	Relaxation time, branch 2
G_3	291 MPa	Shear modulus, branch 3
τ_3	3.16·10 ⁻⁶ s	Relaxation time, branch 3
G_4	212 MPa	Shear modulus, branch 4
τ_4	10 ⁻⁵ s	Relaxation time, branch 4
G_5	112 MPa	Shear modulus, branch 5
τ_5	3.16·10 ⁻⁵ s	Relaxation time, branch 5
G_6	61.6 MPa	Shear modulus, branch 6
τ_6	10 ⁻⁴ s	Relaxation time, branch 6
G_7	29.8 MPa	Shear modulus, branch 7
τ_7	3.16·10 ⁻⁴ s	Relaxation time, branch 7
G_8	16.1 MPa	Shear modulus, branch 8
τ_8	10 ⁻³ s	Relaxation time, branch 8
G_9	7.83 MPa	Shear modulus, branch 9
τ_9	3.16·10 ⁻³ s	Relaxation time, branch 9
G_{10}	4.15 MPa	Shear modulus, branch 10
τ_{10}	10 ⁻² s	Relaxation time, branch 10
G_{11}	2.03 MPa	Shear modulus, branch 11
τ_{11}	3.16·10 ⁻² s	Relaxation time, branch 11
G_{12}	I.II MPa	Shear modulus, branch 12
τ_{12}	0.1 s	Relaxation time, branch 12
G_{13}	0.491 MPa	Shear modulus, branch 13
τ_{13}	0.316 s	Relaxation time, branch 13

TABLE I: MODEL DATA FOR THE VISCOELASTIC DAMPER MODEL.

PROPERTY	VALUE	DESCRIPTION
G_{14}	0.326 MPa	Shear modulus branch 14
τ_{14}	l s	Relaxation time branch 14
G_{15}	8.25·10 ⁻² MPa	Shear modulus branch 15
τ_{15}	3.16 s	Relaxation time branch 15
G_{16}	0.126 MPa	Shear modulus branch 16
τ_{16}	10 s	Relaxation time branch 16
G_{17}	3.73·10 ⁻² MPa	Shear modulus branch 17
τ_{17}	100 s	Relaxation time branch 17
G_{18}	1.18·10 ⁻² MPa	Shear modulus branch 18
τ_{18}	1000 s	Relaxation time branch 18

One of the mounting elements is fixed; the other two are loaded with periodic forces with frequencies in the range 0–5 Hz.

The time-domain representation of the forced solution is computed using the fast Fourier transform (FFT).

Results and Discussion

The harmonic response at 3 Hz is shown in Figure 2.

In the frequency domain, the viscoelastic properties of the material appear as the storage modulus and loss modulus. The computed variation of the viscoelastic moduli with frequency is shown in Figure 3. The result is in very good agreement with the experimental data (Figure 7 in Ref. 2)

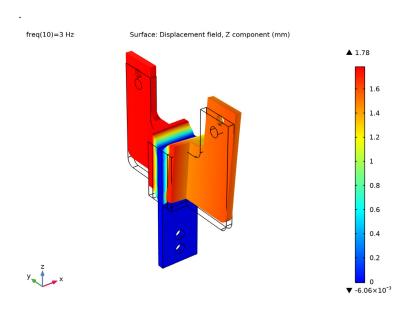

Figure 2: Vertical displacement of the damper, harmonic response.

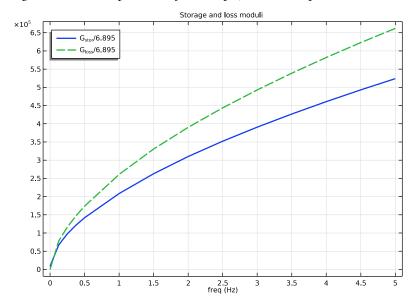

Figure 3: Viscoelastic storage modulus (solid line) and loss modulus (dashed line). Both quantities are normalized by 6.895 to simplify the comparison with Ref. 2.

The time domain solution obtained from a FFT for the case of an excitation frequency of 3 Hz is shown in Figure 4.

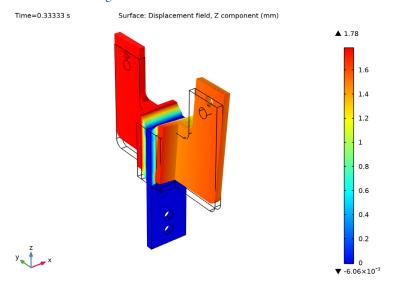

Figure 4: Displacement of the damper after 1/3 second of forced vibrations.

Finally, the total vertical force versus vertical displacement for one of the mounting holes is shown in Figure 5.

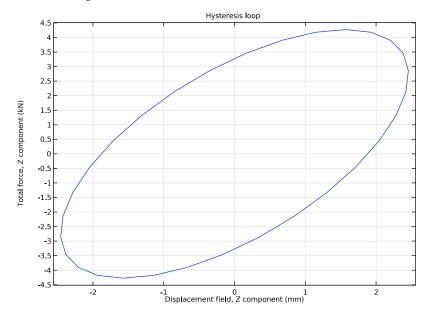

Figure 5: Hysteresis loop for an excitation frequency of 3 Hz over the time interval of 1/3 s.

Notes About the COMSOL Implementation

You model in 3D and use the Solid Mechanics interface with Linear Elastic Material, add the **Viscoelasticity** node to the domains representing the viscoelastic layers.

Application Library path: Structural_Mechanics_Module/ Dynamics_and_Vibration/viscoelastic_damper_frequency From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click **3D**.
- 2 In the Select Physics tree, select Structural Mechanics Solid Mechanics (solid).
- 3 Click Add.
- 4 Click Study.
- 5 In the Select Study tree, select General Studies>Frequency Domain.
- 6 Click M Done.

GEOMETRY I

Import the damper geometry from a file.

Import I (impl)

- I In the Home toolbar, click Import.
- 2 In the Settings window for Import, locate the Import section.
- 3 Click Browse.
- 4 Browse to the model's Application Libraries folder and double-click the file viscoelastic_damper.mphbin.
- 5 Click Import.

The imported geometry should look similar to that shown in Figure 1.

SOLID MECHANICS (SOLID)

Linear Elastic Material 2

- I In the Model Builder window, under Component I (compl) right-click Solid Mechanics (solid) and choose Material Models>Linear Elastic Material.
- 2 In the Settings window for Linear Elastic Material, locate the Linear Elastic Material section.
- 3 From the Specify list, choose Bulk modulus and shear modulus.
- 4 From the Use mixed formulation list, choose Pressure formulation.
- **5** Select Domains 2 and 4 only.

Viscoelasticity I

- I In the Physics toolbar, click 🕞 Attributes and choose Viscoelasticity. Since there are 18 branches in this material model, the data has been collected in a text file which you can load.
- 2 In the Settings window for Viscoelasticity, locate the Viscoelasticity Model section.
- **3** Click to select row number 1 in the table.
- 4 Click Delete.
- 5 Click Load from File.
- 6 Browse to the model's Application Libraries folder and double-click the file viscoelastic_damper_viscoelastic_data.txt.

ADD MATERIAL

- I In the Home toolbar, click **‡ Add Material** to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Steel AISI 4340.
- 4 Click Add to Component in the window toolbar.

MATERIALS

Steel AISI 4340 (mat I)

Select Domains 1, 3, and 5 only.

Viscoelastic

- I In the Model Builder window, right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Viscoelastic in the Label text field.
- **3** Select Domains 2 and 4 only.
- 4 Locate the Material Contents section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Bulk modulus	K	4e8	N/m²	Bulk modulus and shear modulus
Shear modulus	G	5.86e4	N/m²	Bulk modulus and shear modulus
Density	rho	1060	kg/m³	Basic

- 5 In the Home toolbar, click 👯 Add Material to close the Add Material window.
- 6 Click the Show Material Color and Texture button in the Graphics toolbar.

SOLID MECHANICS (SOLID)

Fixed Constraint 1

- I In the Physics toolbar, click **Boundaries** and choose **Fixed Constraint**.
- 2 Select Boundaries 24–27 only.

Prescribed Displacement 1

- I In the Physics toolbar, click **Boundaries** and choose **Prescribed Displacement**.
- 2 Select Boundaries 40 and 41 only.
- 3 In the Settings window for Prescribed Displacement, locate the Prescribed Displacement section.
- 4 Select the Prescribed in x direction check box.
- 5 Select the Prescribed in y direction check box.

Boundary Load 1

- I In the Physics toolbar, click **Boundaries** and choose **Boundary Load**.
- **2** Select Boundaries 40 and 41 only.
- 3 In the Settings window for Boundary Load, locate the Force section.
- **4** Specify the \mathbf{F}_{A} vector as

0	x
0	у
8.5[MPa]	z

Phase I

- I In the Physics toolbar, click 🖳 Attributes and choose Phase.
- 2 In the Settings window for Phase, locate the Phase section.
- **3** Specify the ϕ vector as

0	x
0	у
pi/2	z

Prescribed Displacement 2

- I In the Physics toolbar, click **Boundaries** and choose **Prescribed Displacement**.
- **2** Select Boundaries 32 and 33 only.

- 3 In the Settings window for Prescribed Displacement, locate the Prescribed Displacement section.
- 4 Select the Prescribed in y direction check box.

Boundary Load 2

- I In the Physics toolbar, click **Boundaries** and choose **Boundary Load**.
- 2 Select Boundaries 32 and 33 only.
- 3 In the Settings window for Boundary Load, locate the Force section.
- **4** Specify the \mathbf{F}_{A} vector as

0.5[MPa]	х
0	у
8.5[MPa]	z

MESH I

Mesh the side surfaces of the viscoelastic layers and then sweep the resulting mesh into the layers.

Mapped I

- I In the Mesh toolbar, click A Boundary and choose Mapped.
- 2 Select Boundaries 6 and 20 only.
- 3 In the Settings window for Mapped, click Build Selected.

Swept I

- I In the Mesh toolbar, click A Swept.
- 2 In the Settings window for Swept, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- 4 Select Domains 2 and 4 only.

Distribution I

- I Right-click Swept I and choose Distribution.
- 2 In the Settings window for Distribution, locate the Distribution section.
- 3 In the Number of elements text field, type 3.

Swept I

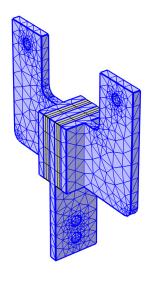

I In the Model Builder window, right-click Swept I and choose Build Selected.

Mesh the rest of the geometry using a free tetrahedral mesh.

Free Tetrahedral I

- I In the Mesh toolbar, click A Free Tetrahedral.
- 2 In the Settings window for Free Tetrahedral, click 📗 Build Selected.

The complete mesh should look similar to that shown in the figure below.

STUDY I

Step 1: Frequency Domain

- I In the Model Builder window, under Study I click Step I: Frequency Domain.
- 2 In the Settings window for Frequency Domain, locate the Study Settings section.
- 3 In the Frequencies text field, type range (0,0.125,0.5) range (1,0.5,5).

Solution I (soll)

In the Study toolbar, click Show Default Solver.

RESULTS

Before computing the solution, set up a displacement plot that will be displayed and updated after every frequency response computation.

Displacement, Frequency Domain

I In the Home toolbar, click Add Plot Group and choose 3D Plot Group.

2 In the Settings window for 3D Plot Group, type Displacement, Frequency Domain in the Label text field.

Surface I

- I Right-click Displacement, Frequency Domain and choose Surface.
- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Solid Mechanics> Displacement>Displacement field m>w Displacement field, Z component.
- 3 Locate the Expression section. From the Unit list, choose mm.
- 4 Locate the Coloring and Style section. From the Color table list, choose RainbowLight.

Deformation I

Right-click Surface I and choose Deformation.

STUDY I

Step 1: Frequency Domain

- In the Settings window for Frequency Domain, click to expand the Results While Solving section.
- **2** Select the **Plot** check box.

Solution I (soll)

In the Model Builder window, under Study I>Solver Configurations right-click Solution I (soll) and choose Compute.

RESULTS

Displacement, Frequency Domain

- I In the Settings window for 3D Plot Group, locate the Data section.
- 2 From the Parameter value (freq (Hz)) list, choose 3.
- 3 Locate the Color Legend section. Select the Show maximum and minimum values check box.
- 4 In the **Displacement, Frequency Domain** toolbar, click **Plot**.

 The computed solution should closely resemble that shown in Figure 2.

To plot the storage and loss moduli, follow these steps:

Cut Point 3D I

- I In the Results toolbar, click Cut Point 3D.
- 2 In the Settings window for Cut Point 3D, locate the Point Data section.

- 3 In the X text field, type 0.
- 4 In the **Z** text field, type 0.
- **5** In the **Y** text field, type -0.01.

Storage and Loss Moduli

- I In the Results toolbar, click \sim ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Storage and Loss Moduli in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Cut Point 3D 1.
- 4 Click to expand the **Title** section. From the **Title type** list, choose **Manual**.
- 5 In the Title text area, type Storage and loss moduli.
- 6 Locate the Legend section. From the Position list, choose Upper left.

Point Graph 1

- I Right-click Storage and Loss Moduli and choose Point Graph.
- 2 In the Settings window for Point Graph, locate the y-Axis Data section.
- 3 In the Expression text field, type solid. Gstor/6.895.
- 4 Click to expand the Coloring and Style section. In the Width text field, type 2.
- **5** Click to expand the **Legends** section. Select the **Show legends** check box.
- 6 From the Legends list, choose Manual.
- **7** In the table, enter the following settings:

Legends G_{stor}/6.895

Point Graph 2

- I In the Model Builder window, right-click Storage and Loss Moduli and choose Point Graph.
- 2 In the Settings window for Point Graph, locate the y-Axis Data section.
- 3 In the Expression text field, type solid.Gloss/6.895.
- 4 Click to expand the Coloring and Style section. Find the Line style subsection. From the Line list, choose Dashed.
- 5 In the Width text field, type 2.
- **6** Locate the **Legends** section. Select the **Show legends** check box.
- 7 From the Legends list, choose Manual.

8 In the table, enter the following settings:

```
Legends
G<sub>loss</sub>/6.895
```

9 In the Storage and Loss Moduli toolbar, click Plot.

Add a new study to compute by using FFT the solution representation in time domain for the exitation frequency of 3 Hz.

ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select Empty Study.
- 4 Click + Add Study.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

STUDY 2

Frequency to Time FFT

- I In the Study toolbar, click Study Steps and choose Time Dependent> Frequency to Time FFT.
- 2 In the Settings window for Frequency to Time FFT, locate the Study Settings section.
- 3 From the Input study list, choose Study I, Frequency Domain.
- 4 In the Times text field, type range (0, 1/(3*30), 1/3).
- **5** Select the **Use window function** check box.
- 6 From the Window function list, choose Rectangular.
- 7 In the Window start text field, type 2.9.
- 8 In the Window end text field, type 3.1.
- **9** From the Scaling list, choose Discrete Fourier transform.

DEFINITIONS

Set up a variable to compute the time domain equivalent of the total force applied to one of the mounting holes.

Variables 1

- I In the Home toolbar, click a= Variables and choose Local Variables.
- 2 In the Settings window for Variables, locate the Variables section.

3 In the table, enter the following settings:

Name	Expression	Unit	Description
Fz1	8.5[MPa]*cos(2*pi*t* 3[Hz])*pi*16[mm]*10[mm]	N	Total force, Z component

4 In the Home toolbar, click **Compute**.

RESULTS

Displacement, Time Domain

The default plot will show the stress at the last time moment. Change it to visualize the vertical displacement as shown in Figure 4.

- I In the Settings window for 3D Plot Group, type Displacement, Time Domain in the Label text field.
- 2 Locate the Color Legend section. Select the Show maximum and minimum values check box.

Surface I

- I In the Model Builder window, expand the Displacement, Time Domain node, then click Surface 1.
- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Solid Mechanics> Displacement>Displacement field - m>w - Displacement field, I component.
- **3** Locate the **Expression** section. From the **Unit** list, choose **mm**.
- 4 In the Displacement, Time Domain toolbar, click Plot.

Hysteresis Loop

- I In the Home toolbar, click **Add Plot Group** and choose ID Plot Group. Plot the total vertical force versus vertical displacement for one of the mounting holes, Figure 5.
- 2 In the Settings window for ID Plot Group, type Hysteresis Loop in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Study 2/Solution 2 (sol2).

Point Graph 1

- I Right-click Hysteresis Loop and choose Point Graph.
- 2 In the Settings window for Point Graph, locate the Selection section.
- **3** Select the Activate Selection toggle button.

- **4** Select Point 23 only.
- 5 Locate the y-Axis Data section. In the Expression text field, type Fz1.
- 6 From the Unit list, choose kN.
- 7 Locate the x-Axis Data section. From the Parameter list, choose Expression.
- **8** In the **Expression** text field, type w.
- **9** From the **Unit** list, choose **mm**.
- 10 Click to expand the Title section. From the Title type list, choose Manual.
- II In the **Title** text area, type Hysteresis loop.
- 12 In the Hysteresis Loop toolbar, click **Plot**.
