

# Modeling of an Electric Generator in 3D

## Introduction

This application illustrates how to model an electric machine, such as a generator, motor, or drive, by exploiting its sector symmetry to reduce the size of the problem. The machine being studied is a simplified electric generator in 3D, based on the geometry used in the Generator in 2D application.

The application uses the **Rotating Machinery**, **Magnetic** interface. It is recommended to have a look at the model Rotating Machinery 3D Tutorial before proceeding with this application.

# Model Definition

The complete geometry is represented in Figure 1. Parts of the stator have been removed to show the rotor. The core of the rotor and the stator consists of laminated ( $\sigma = 0 \text{ S/m}$ ), saturable iron. The teeth of the rotor are permanent magnets from available materials.

The generator rotates with a rotational velocity of 60 rpm, and the model is solved in the time domain from t = 0 s to t = 0.25 s, after which the rotor arrived to a configuration symmetrically equivalent to the starting one.

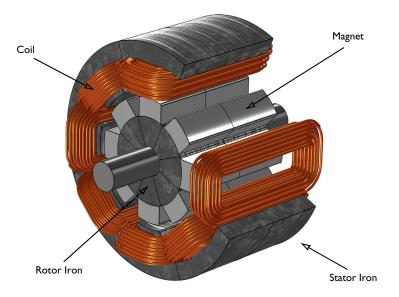

Figure 1: Geometry of the generator.

The geometry has two types of symmetry: the sector symmetry and a reflection symmetry with respect to the midplane orthogonal to the axis, so it can be reduced to the sector geometry shown in Figure 2. The figure indicates the appropriate conditions to use on the symmetry cut boundaries:

- Periodic Boundary Conditions must be used on the sides of the sector symmetry. The type of periodicity chosen is **Antiperiodicity**, since the inputs to the model (the remanent flux density in the permanent magnets) change sign in adjacent sectors.
- The **Sector Symmetry** pair condition is applied on the identity pair created by the geometry at the contact boundary between rotor and stator. The type of periodicity must match the type specified in the Periodic Boundary Condition features, that is, Antiperiodicity.
- The reflection symmetry forces the normal component of the magnetic field to be zero at the midplane. This condition is imposed by the default Magnetic Insulation feature.

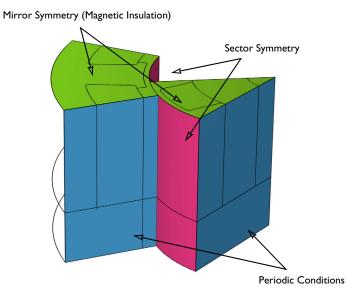

Figure 2: Boundary conditions used to take into account the model symmetry.

#### MODELING THE COIL

The stator coil has a nonregular shape, that does not fall in the Linear or Circular category. The direction of the coil can be computed in a preprocessing **Coil Geometry Analysis** step. The stator coil is affected by the symmetry cut as well. The modeled length of the coil is 1/16 of the actual length (due to the 8-fold sector symmetry and the mirror symmetry). To ensure that the lumped quantities such as the coil voltage or the current are computed correctly, specify appropriate Symmetry factors in the Geometry Analysis subnode under the Coil node.

#### THE MIXED FORMULATION

The application uses the Mixed formulation functionality of the Rotating Machinery, Magnetic interface. It solves the magnetic scalar potential  $V_{\rm m}$  in nonconductive regions and for the magnetic vector potential **A**. The scalar formulation is solved by **Magnetic Flux** Conservation features, while the vector formulation is solved by Ampére's Law features. Advantages of using the scalar potential formulation in the air gap and nonconductive regions are:

- More accurate magnetic flux conservation by the pair coupling (Sector Symmetry). For this reason, it is important to use the scalar potential in the regions adjacent to a pair.
- Decreased number of degrees of freedom compared with the vector formulation.

The limitation of the scalar formulation is that it cannot be used in conductive domains or domains carrying currents, nor in regions that contain closed loop chaining a current (for example, it cannot be used in the air region surrounding the coil).

Care must be taken when using periodic condition in a sector-symmetric model, since the topological condition on the scalar potential regions must be fulfilled in the complete geometry as well.

#### DIRECT SOLVERS AND UNIQUENESS OF THE SOLUTION

The Rotating Machinery, Magnetic interface, by default, uses a direct solver for stationary and transient simulations. Direct solvers are typically better performing than iterative solvers at the cost of increased memory usage.

Direct solvers can only find a solution if it is unique, unlike iterative solvers. The vector potential formulation is subject to gauge freedom, meaning that the solution is unique up to a gauge transformation. To ensure a globally unique solution for the stationary study step, it is necessary to choose (fix) the gauge by using the Gauge Fixing for A-Field feature in all domains where the vector formulation is used. For the time-dependent study step, however, the Gauge fixing is not required if the conductivity of these domains is not zero in the numerical sense. More information about the electromagnetic gauge and gauge fixing can be found in the AC/DC Module User's Guide.

#### LOSS CALCULATION

The resistive and iron losses are computed with the use of a Loss Calculation subfeature and a Time to Frequency Losses study. For the iron part of the generator, the Bertotti loss model is selected to compute the cycle averaged loss power density. A volume integration is then made to compute the total loss power of the generator. The generated voltage and the losses are compared with the 2D counterpart of this model, that is, Generator in 2D.

# Results and Discussion

A sector plot of magnetic flux density is presented in Figure 3. The solution is plotted in the spatial frame, in which the rotor moves.

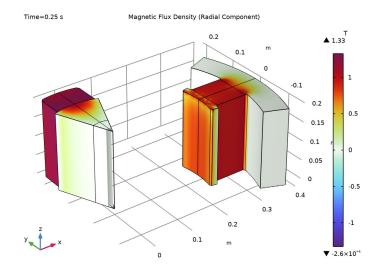

Figure 3: Sector plot of the magnetic flux density.

To visualize the solution in the complete geometry, reconstruct it using Sector 3D and Mirror datasets. These specialized datasets create another solution by rotating and mirroring other datasets according to the specification.

To properly account for the antisymmetry, select the **Invert phase when rotating** check box in the Sector 3D dataset. This functionality changes the sign of the solution when creating adjacent sectors. The resulting plot is shown in Figure 4.

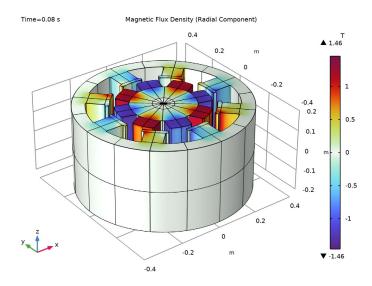

Figure 4: Plot of the magnetic flux density in the complete, reconstructed geometry.

Finally, Figure 5 shows the induced coil voltage as a function of time. The voltage takes into account the number of wires in the multi-turn coil and the symmetry. The simulated voltage is in good agreement with the result from the corresponding 2D model, see Figure 3 in the application Generator in 2D.

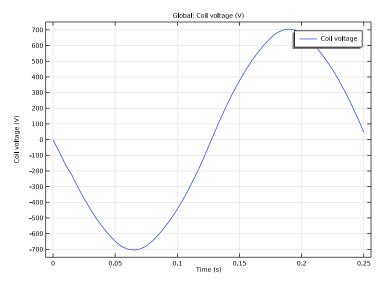

Figure 5: Voltage induced in the complete coil as a function of time.

**Application Library path:** ACDC\_Module/Motors\_and\_Actuators/ sector generator 3d

# Modeling Instructions

From the File menu, choose New.

#### NEW

In the New window, click Model Wizard.

## MODEL WIZARD

- I In the Model Wizard window, click **1** 3D.
- 2 In the Select Physics tree, select AC/DC>Electromagnetics and Mechanics> Rotating Machinery, Magnetic (rmm).
- 3 Click Add.

- 4 Click Study.
- 5 In the Select Study tree, select Preset Studies for Selected Physics Interfaces> Coil Geometry Analysis.
- 6 Click Done.

#### **GLOBAL DEFINITIONS**

Define Model Parameters: global, constant expressions that can be used anywhere in the application.

#### Parameters 1

- I In the Model Builder window, under Global Definitions click Parameters I.
- 2 In the Settings window for Parameters, locate the Parameters section.
- **3** In the table, enter the following settings:

Name	Expression	Value	Description	
d_wire	3[mm]	0.003 m	Diameter of wire in the winding	
N	100	100	Number of turns in the winding	
rpm	60[rpm]	I I/s	Angular velocity of the rotor	

#### GEOMETRY I

Insert the geometry sequence from a separate file using the **Insert Sequence** functionality. This functionality copies all the subnodes of the Geometry node in the chosen file to the current model.

- I In the Geometry toolbar, click Insert Sequence and choose Insert Sequence.
- 2 Browse to the model's Application Libraries folder and double-click the file sector\_generator\_3d\_geom\_sequence.mph.
- 3 In the Geometry toolbar, click **Build All**.
- 4 Click the Zoom Extents button in the Graphics toolbar.

The geometry represents a sector of the complete generator, further halved along the xy-symmetry plane. The geometry is composed of two objects, one for the rotor and one for the stator. They have been constructed from the individual components using two **Union** operations. The geometry is finalized by using **Form Assembly**, which detects the touching boundaries and creates an **Identity Pair** connecting them.

#### DEFINITIONS

Proceed to the definition of Selection nodes: named collection of geometric entities (such as domains or boundaries) that can be reused when applying equations, boundary conditions, and other features. New selections can also be obtained by applying more advanced operations on other Selections, such as taking the complement or the adjacent entities. Using Selections simplifies the workflow, especially in models with complex geometries. Explicit selections are named selections in which the entities (domains, in this case) are selected explicitly.

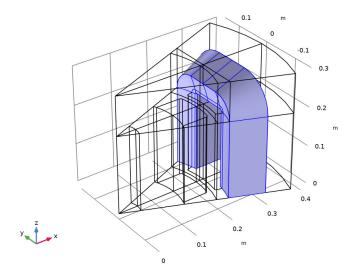

# Cylindrical System 2 (sys2)

I In the **Definitions** toolbar, click Z Coordinate Systems and choose Cylindrical System. The cylindrical coordinate system just created will be used to define the field of the permanent magnets.

#### Stator Coil

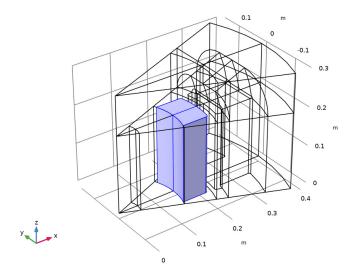

- I In the **Definitions** toolbar, click **\( \bigcap\_{\bigcap} \) Explicit**.
- 2 In the Settings window for Explicit, type Stator Coil in the Label text field.
- 3 Click the Wireframe Rendering button in the Graphics toolbar. You can conveniently add domain entities with the Paste Selection view instead of clicking the domains manually:
- 4 Locate the Input Entities section. Click Paste Selection.
- 5 In the Paste Selection dialog box, type 17 19 20 22 23 24 in the Selection text field (the domains belonging to the coil).

# 6 Click OK.

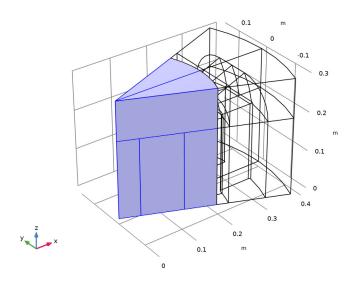

# Permanent Magnet

- I In the **Definitions** toolbar, click **\( \bigcap\_{\text{a}} \) Explicit**.
- 2 In the Settings window for Explicit, type Permanent Magnet in the Label text field.
- **3** Select Domains 9 and 10 only (the magnet domain).

# Rotating Domains

- I In the **Definitions** toolbar, click 堶 **Explicit**.
- 2 In the Settings window for Explicit, type Rotating Domains in the Label text field.
- **3** Select Domains 1–10 only (all the domains in the rotor).

#### DEFINITIONS

Create a selection for the stationary domains by taking the complement of the rotor selection.

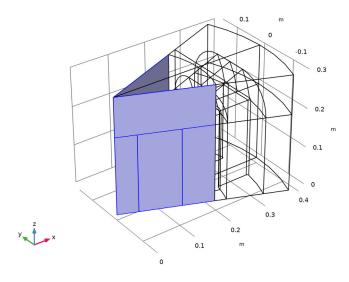

# Stationary Domains

- I In the Definitions toolbar, click \( \frac{1}{2} \) Complement.
- 2 In the Settings window for Complement, type Stationary Domains in the Label text field.
- 3 Locate the Input Entities section. Under Selections to invert, click + Add.
- 4 In the Add dialog box, select Rotating Domains in the Selections to invert list.
- 5 Click OK.

## Periodic Condition: Rotor

- I In the **Definitions** toolbar, click **\( \bigcap\_{\bigcap} \) Explicit**.
- 2 In the Settings window for Explicit, type Periodic Condition: Rotor in the Label text field.

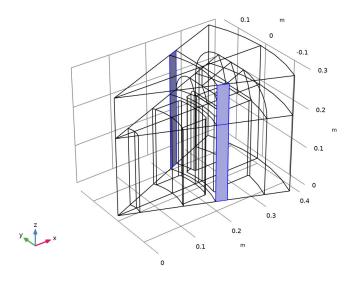

- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- **4** Select Boundaries 1, 2, 6, 7, 14, 18, 23, and 27 only.

Periodic Condition: Stator, Scalar Potential

- 2 In the Settings window for Explicit, type Periodic Condition: Stator, Scalar Potential in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.

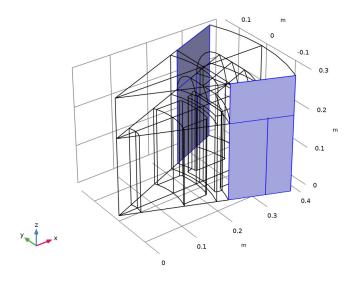

4 Select Boundaries 49, 52, 56, and 59 only.

Periodic Condition: Stator, Vector Potential

- I In the **Definitions** toolbar, click **\( \bigcap\_{\text{a}} \) Explicit**.
- 2 In the Settings window for Explicit, type Periodic Condition: Stator, Vector Potential in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.

**4** Select Boundaries 75, 78, 96, 98, 118, and 125 only.

#### Destination

- I In the **Definitions** toolbar, click **\( \frac{1}{2} \) Explicit**.
- 2 In the Settings window for Explicit, type Destination in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- 4 Select Boundaries 41–44 only.

#### Source

- I In the **Definitions** toolbar, click **\( \bigcap\_{\bigcap} \) Explicit**.
- 2 In the Settings window for Explicit, type Source in the Label text field.
- 3 Locate the Input Entities section. From the Geometric entity level list, choose Boundary.
- 4 Select Boundaries 48, 51, 55, and 58 only.

#### Identity Boundary Pair I (ap I)

Finally, ensure that the **Destination** side of the identity pair is on the moving domain. This gives a better performance during the solution.

Check the **Source Boundaries** and the **Destination Boundaries** and make sure that the moving domains are in the destination side. The boundaries are numbered progressively with increasing x-coordinate, so the boundaries on the rotor side have lower numbers. Click the Swap Source and Destination button to swap the boundary assignment and put the boundaries with the lower numbers in the destination side.

#### ADD MATERIAL

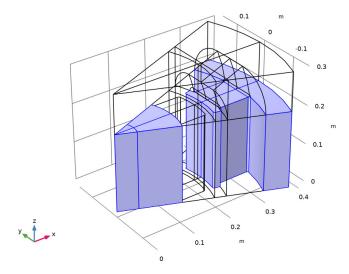

Proceed with the definition of the materials.

- I In the Home toolbar, click **Add Material** to open the Add Material window.
- 2 Go to the Add Material window.
- 3 In the tree, select Built-in>Air.
- 4 Right-click and choose Add to Component I (compl).
- 5 In the tree, select AC/DC>Soft Iron (Without Losses).
- 6 Right-click and choose Add to Component I (compl).
- 7 In the tree, select AC/DC>Hard Magnetic Materials> Sintered NdFeB Grades (Chinese Standard)>N50 (Sintered NdFeB).
- 8 Click Add to Component in the window toolbar.
- 9 In the Home toolbar, click **‡ Add Material** to close the **Add Material** window.

## MATERIALS

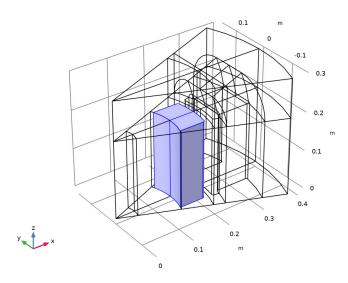

Soft Iron (Without Losses) (mat2)

- I In the Model Builder window, under Component I (compl)>Materials click Soft Iron (Without Losses) (mat2).
- **2** Select Domains 1, 2, 5, 6, 15, and 16 only.

# N50 (Sintered NdFeB) (mat3)

- I In the Model Builder window, click N50 (Sintered NdFeB) (mat3).
- 2 In the Settings window for Material, locate the Geometric Entity Selection section.
- 3 From the Selection list, choose Permanent Magnet.

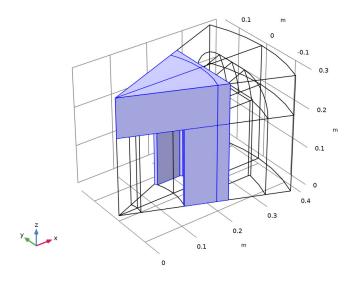

## ROTATING MACHINERY, MAGNETIC (RMM)

Move on to the setup of the physics interface.

# Magnetic Flux Conservation: Air Gap

- I In the Model Builder window, under Component I (compl) right-click Rotating Machinery, Magnetic (rmm) and choose Magnetic Flux Conservation.
- 2 In the Settings window for Magnetic Flux Conservation, type Magnetic Flux Conservation: Air Gap in the Label text field.

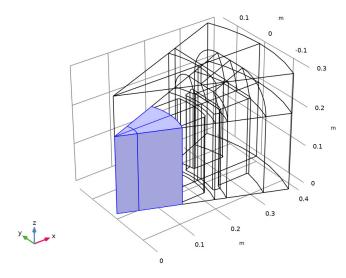

**3** Select Domains 3, 4, 7, 8, and 11–14 only.

Magnetic Flux Conservation: Rotor Iron

- I In the Physics toolbar, click **Domains** and choose Magnetic Flux Conservation.
- 2 In the Settings window for Magnetic Flux Conservation, type Magnetic Flux Conservation: Rotor Iron in the Label text field.

**3** Select Domains 1, 2, 5, and 6 only.

4 Locate the Constitutive Relation B-H section. From the Magnetization model list, choose B-H curve.

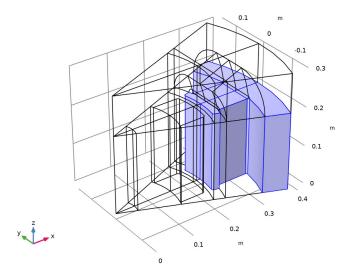

Loss Calculation I

- I In the Physics toolbar, click 🕞 Attributes and choose Loss Calculation. Set loss model to Bertotti.
- 2 In the Settings window for Loss Calculation, locate the Loss Model section.
- 3 From the Loss model list, choose Bertotti.

Ampère's Law: Stator Iron

- I In the Physics toolbar, click Domains and choose Ampère's Law.
- 2 In the Settings window for Ampère's Law, type Ampère's Law: Stator Iron in the Label text field.

3 Select Domains 15 and 16 only.

4 Locate the Constitutive Relation B-H section. From the Magnetization model list, choose B-H curve.

Loss Calculation I

- I In the Physics toolbar, click 🕞 Attributes and choose Loss Calculation.
- 2 In the Settings window for Loss Calculation, locate the Loss Model section.
- 3 From the Loss model list, choose Bertotti.

#### Magnet

- I In the Physics toolbar, click **Domains** and choose Ampère's Law.
- 2 In the Settings window for Ampère's Law, type Magnet in the Label text field.
- 3 Select Domains 9 and 10 only.
- 4 Locate the Coordinate System Selection section. From the Coordinate system list, choose Cylindrical System 2 (sys2).
- 5 Locate the Constitutive Relation B-H section. From the Magnetization model list, choose Remanent flux density.

Loss Calculation I

In the Physics toolbar, click 🕞 Attributes and choose Loss Calculation.

#### Coil I

- I In the Physics toolbar, click **Domains** and choose **Coil**.
- 2 In the Settings window for Coil, locate the Domain Selection section.
- 3 From the Selection list, choose Stator Coil.
- 4 Locate the Coil section. From the Conductor model list, choose Homogenized multiturn.
- 5 From the Coil type list, choose Numeric.

This setting requires to solve a **Coil Geometry Analysis** preprocessing step.

- **6** In the  $I_{\text{coil}}$  text field, type O[A].
- 7 Locate the Homogenized Multiturn Conductor section. In the N text field, type N.
- 8 From the Coil wire cross-section area list, choose From round wire diameter.
- **9** In the  $d_{\mathrm{coil}}$  text field, type d\_wire.

# Geometry Analysis I

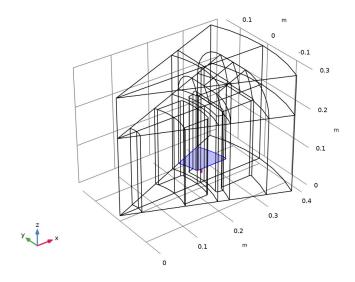

The coil domain is only 1/16 of the total length of the coil (due to symmetry). Use the functionality in the Geometry Analysis subfeature to apply the appropriate corrections to the lumped quantities, such as the induced voltage.

- I In the Model Builder window, click Geometry Analysis I.
- 2 In the Settings window for Geometry Analysis, locate the Coil Geometry section.
- **3** Find the **Symmetry specification** subsection. In the  $F_L$  text field, type 16.

#### Input I

I In the Model Builder window, expand the Geometry Analysis I node, then click Input I.

**2** Select Boundary 97 only (one of the two boundaries at the symmetry cut).

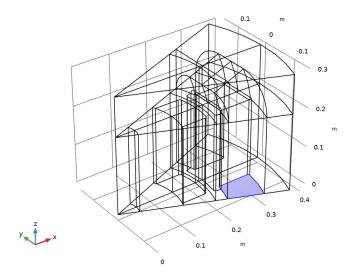

Geometry Analysis I

In the Model Builder window, click Geometry Analysis 1.

# Output I

I In the Physics toolbar, click 🕞 Attributes and choose Output.

**2** Select Boundary 76 only (the other boundary at the symmetry cut).

Gauge Fixing for A-field I

The default solver for the 3D Rotating Machinery, Magnetic interface is the direct solver, which gives better performance in time-dependent studies and with the mixed formulation. A direct solver requires that the solution is unique, so it is necessary to apply the Gauge Fixing feature. The Stationary form of Gauge Fixing is enforced so to be able to support regions with zero conductivity.

- I In the Physics toolbar, click **Domains** and choose **Gauge Fixing for A-field**.
- 2 Click the Show More Options button in the Model Builder toolbar.
- 3 In the Show More Options dialog box, in the tree, select the check box for the node Physics>Advanced Physics Options.
- 4 Click OK.

## Sector Symmetry 1

The Sector Symmetry feature sets up the appropriate rotational-periodic coupling at the identity pair.

- I In the Physics toolbar, click Pairs and choose Sector Symmetry.
- 2 In the Settings window for Sector Symmetry, locate the Pair Selection section.
- 3 Under Pairs, click + Add.
- 4 In the Add dialog box, select Identity Boundary Pair I (ap I) in the Pairs list.

- 5 Click OK.
- 6 In the Settings window for Sector Symmetry, locate the Sector Settings section.
- 7 In the  $n_{\text{sect}}$  text field, type 8.
- 8 From the Type of periodicity list, choose Antiperiodicity.
- 9 Click to expand the Constraint Settings section. Select the Use weak constraints check box.

#### Periodic Condition I

Apply periodic conditions on the periodic boundaries.

- I In the Physics toolbar, click **Boundaries** and choose Periodic Condition.
- 2 In the Settings window for Periodic Condition, locate the Boundary Selection section.
- **3** From the Selection list, choose Periodic Condition: Rotor.
- 4 Locate the Periodic Condition section. From the Type of periodicity list, choose Antiperiodicity.

#### Periodic Condition 2

- I In the Physics toolbar, click **Boundaries** and choose Periodic Condition.
- 2 In the Settings window for Periodic Condition, locate the Boundary Selection section.
- 3 From the Selection list, choose Periodic Condition: Stator, Scalar Potential.
- 4 Locate the Periodic Condition section. From the Type of periodicity list, choose Antiperiodicity.

#### Periodic Condition 3

- I In the Physics toolbar, click **Boundaries** and choose Periodic Condition.
- 2 In the Settings window for Periodic Condition, locate the Boundary Selection section.
- 3 From the Selection list, choose Periodic Condition: Stator, Vector Potential.
- 4 Locate the Periodic Condition section. From the Type of periodicity list, choose Antiperiodicity.
- 5 In the Definitions toolbar, click Moving Mesh and choose Domains>Rotating Domain.

#### MOVING MESH

## Rotating Domain I

- I In the Settings window for Rotating Domain, locate the Domain Selection section.
- 2 From the Selection list, choose Rotating Domains.

- 3 Locate the Rotation section. From the Rotation type list, choose Specified rotational velocity.
- 4 From the Rotational velocity expression list, choose Constant revolutions per time.
- **5** In the *f* text field, type rpm.

# ROTATING MACHINERY, MAGNETIC (RMM)

- I In the Model Builder window, under Component I (compl) click Rotating Machinery, Magnetic (rmm).
- 2 In the Settings window for Rotating Machinery, Magnetic, click to expand the Discretization section.
- 3 From the Magnetic vector potential list, choose Linear.
- 4 From the Magnetic scalar potential list, choose Linear.

Set the electrical conductivity of air and soft iron to a finite small value (1[S/m]) to improve the numerical stability.

#### MATERIALS

Air (mat I)

- I In the Model Builder window, under Component I (compl)>Materials click Air (matl).
- 2 In the Settings window for Material, locate the Material Contents section.
- **3** In the table, enter the following settings:

Property	Variable	Value	Unit	Property group
Electrical conductivity	sigma_iso; sigmaii = sigma_iso, sigmaij = 0	1[S/m]	S/m	Basic

Soft Iron (Without Losses) (mat2)

- I In the Model Builder window, click Soft Iron (Without Losses) (mat2).
- 2 In the Settings window for Material, locate the Material Contents section.

3 In the table, enter the following settings:

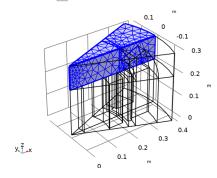

Property	Variable	Value	Unit	Property group
Electrical conductivity	sigma_iso; sigmaii = sigma_iso, sigmaij = 0	1[S/m]	S/m	Basic

#### MESH I

For curl elements that describe the vector potential **A**, it is important that the mesh is congruent on the two symmetry surfaces, that is, there is a one-to-one mapping between the mesh elements on either side. This eliminates the need for interpolation between mismatching mesh elements which would have a negative impact on accuracy and solver stability. Create a congruent mesh by meshing half of the sector geometry and copying it to the remaining domains. You can also utilize the extrusion along the rotational axis by using a swept mesh, which reduces the size of the problem. Begin by meshing half of the non-extruded domains:

## Free Tetrahedral I

- I In the Mesh toolbar, click A Free Tetrahedral.
- 2 In the Settings window for Free Tetrahedral, locate the Domain Selection section.
- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domains 4, 14, and 21–23 only.
- 5 Click **Build Selected**.

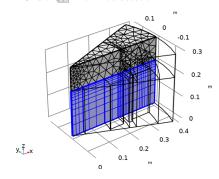

Swept I

- I In the Mesh toolbar, click A Swept.
- 2 In the Settings window for Swept, locate the Domain Selection section.

- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domains 2, 6, 8, 10, 13, 16, and 24 only.

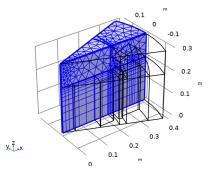

#### Distribution 1

- I Right-click Swept I and choose Distribution.
- 2 In the Settings window for Distribution, locate the Distribution section.
- **3** From the **Distribution type** list, choose **Predefined**.
- 4 In the Number of elements text field, type 10.
- **5** In the **Element ratio** text field, type **10**.
- 6 From the Growth rate list, choose Exponential.
- 7 Click **Build Selected**.

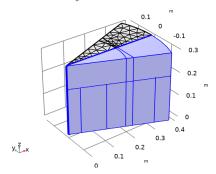

# Copy Domain I

- I In the Model Builder window, right-click Mesh I and choose Copying Operations> Copy Domain.
- **2** Select Domains 2, 4, 6, 8, 10, 13, 14, 16, and 21–24 only.
- 3 Click the Go to Default View button in the Graphics toolbar.

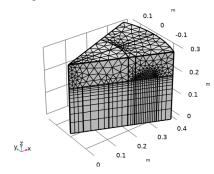

4 In the Settings window for Copy Domain, locate the Destination Domains section.

- **5** Click to select the **Activate Selection** toggle button.
- **6** Select Domains 1, 3, 5, 7, 9, 11, 12, 15, and 17–20 only.
- 7 Click the Go to Default View button in the Graphics toolbar.

8 Right-click Mesh I and choose Build All.

## STUDY I

Complete the definition of the study. After the Coil Geometry Analysis step added earlier, add a Stationary step (to compute the initial values for the transient step) and the main Time Dependent step.

## Stationary

In the Study toolbar, click Study Steps and choose Stationary>Stationary.

## Time Dependent

- I In the Study toolbar, click Study Steps and choose Time Dependent> Time Dependent.
- 2 In the Settings window for Time Dependent, locate the Study Settings section.

- 3 In the Output times text field, type range (0,0.005,0.25).
  - For time-dependent study with finite conductivity in all domains, it is not necessary to use the gauge fixing. Next, it is disabled to make the model cheaper to solve.
- 4 Locate the Physics and Variables Selection section. Select the Modify model configuration for study step check box.
- 5 In the tree, select Component I (Compl)>Rotating Machinery, Magnetic (Rmm)> Gauge Fixing for A-field 1.
- 6 Right-click and choose Disable.

Solution I (soll)

- I In the Study toolbar, click Show Default Solver.
  - Use a stricter tolerance for the stationary step to compute more accurate initial values. This improves the performance of the time dependent solver. Then operate on the setting of the transient solver so to enforce a tighter convergence at each step.
- 2 In the Model Builder window, expand the Solution I (soll) node, then click Stationary Solver 2.
- 3 In the Settings window for Stationary Solver, locate the General section.
- 4 In the Relative tolerance text field, type 1e-6.
- 5 In the Model Builder window, under Study 1>Solver Configurations>Solution 1 (sol1) click Dependent Variables 3.
- 6 In the Settings window for Dependent Variables, locate the Scaling section.
- **7** From the **Method** list, choose **None**.
- 8 In the Model Builder window, expand the Study I>Solver Configurations> Solution I (soll)>Time-Dependent Solver I node, then click Direct.
- 9 In the Settings window for Direct, locate the General section.
- 10 From the Solver list, choose PARDISO.
- II In the Model Builder window, under Study I>Solver Configurations>Solution I (soll)> Time-Dependent Solver I click Fully Coupled I.
- 12 In the Settings window for Fully Coupled, click to expand the Method and Termination section.
- 13 From the Jacobian update list, choose On every iteration.
- 14 In the Maximum number of iterations text field, type 25.

Before proceeding with computing the solution, prepare a plot that is to be shown during solving. Start by adding a selection to the main dataset.

#### RESULTS

In the Model Builder window, expand the Results node.

Study I/Solution I (soll)

In the Model Builder window, expand the Results>Datasets node, then click Study 1/ Solution I (soll).

## Selection

- I In the Results toolbar, click has a Attributes and choose Selection.
- 2 In the Settings window for Selection, locate the Geometric Entity Selection section.
- 3 From the Geometric entity level list, choose Domain.
- **4** Select Domains 1, 2, 5, 6, 9, 10, 15, and 16 only.

Reconstruct the complete geometry using Mirror and Sector 3D datasets.

## Sector 3D I

- I In the Results toolbar, click More Datasets and choose Sector 3D.
- 2 In the Settings window for Sector 3D, locate the Symmetry section.
- 3 In the Number of sectors text field, type 8.
- 4 Click to expand the Advanced section. Select the Invert phase when rotating check box.

# Complete Geometry, Iron

- I In the Results toolbar, click More Datasets and choose Mirror 3D.
- 2 In the Settings window for Mirror 3D, type Complete Geometry, Iron in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Sector 3D 1.
- 4 Locate the Plane Data section. From the Plane list, choose xy-planes.

#### Magnetic Flux Density (Radial Component)

- I In the Results toolbar, click **3D Plot Group**.
- 2 In the Settings window for 3D Plot Group, type Magnetic Flux Density (Radial Component) in the Label text field.
- 3 Locate the Data section. From the Dataset list, choose Complete Geometry, Iron.
- 4 Click to expand the **Title** section. From the **Title type** list, choose **Label**. Visualize the solution in the Spatial frame (the fixed "laboratory" frame), in which the rotor is moving.
- 5 Locate the Plot Settings section. From the Frame list, choose Spatial (x, y, z).

- 6 Locate the Color Legend section. Select the Show maximum and minimum values check box.
- 7 Select the **Show units** check box.

#### Volume 1

- I Right-click Magnetic Flux Density (Radial Component) and choose Volume.
  - One way to define the radial component of  $\mathbf{B}$ , is to write it as  $\mathbf{r} \cdot \mathbf{B}$ , where  $\mathbf{r}$  is a unit vector pointing in the radial direction. You can retrieve it from the cylindrical coordinate system.
- 2 In the Settings window for Volume, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)>Definitions> Cylindrical System 2>Base vector (sys2) r (spatial frame)>sys2.e\_r1 - Base vector (sys2) r, x component.

Now finish the equation as follows:

- 3 Locate the Expression section. In the Expression text field, type sys2.e r1\*rmm.Bx+ sys2.e r2\*rmm.By.
- 4 Select the **Description** check box.
- 5 In the associated text field, type Magnetic flux density, r component.
- 6 Locate the Coloring and Style section. From the Color table list, choose Dipole.
- 7 From the Scale list, choose Linear symmetric.

#### STUDY

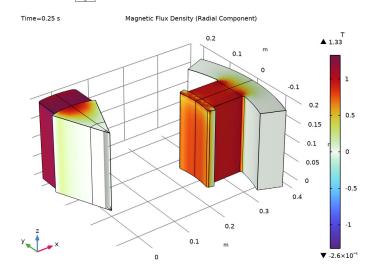

#### Step 3: Time Dependent

- I In the Model Builder window, under Study I click Step 3: Time Dependent.
- 2 In the Settings window for Time Dependent, click to expand the Results While Solving section.
- **3** Select the **Plot** check box.
- 4 From the Update at list, choose Time steps taken by solver.
- 5 In the Model Builder window, click Study 1.
- 6 In the Settings window for Study, locate the Study Settings section.
- 7 Clear the Generate default plots check box.
  - Now that the plot has been prepared and set to be shown during solving, proceed by computing the solution.
- 8 In the Home toolbar, click **Compute**.

## RESULTS

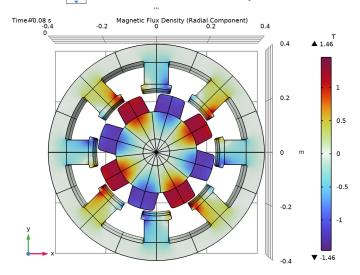

Magnetic Flux Density (Radial Component)

- I In the Settings window for 3D Plot Group, locate the Data section.
- 2 From the Dataset list, choose Study I/Solution I (soll).
- 3 In the Magnetic Flux Density (Radial Component) toolbar, click Plot.
- **4** Click the **Zoom Extents** button in the **Graphics** toolbar.

- 5 From the Dataset list, choose Complete Geometry, Iron.
- 6 From the Time (s) list, choose 0.08.
- **8** Click the **XY Yiew** button in the **Graphics** toolbar.

**9** Click the **Your Extents** button in the **Graphics** toolbar.

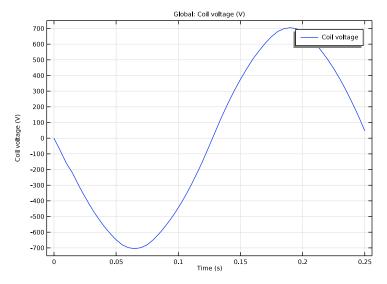

# Induced Coil Voltage

- I In the Home toolbar, click Add Plot Group and choose ID Plot Group.
- 2 In the Settings window for ID Plot Group, type Induced Coil Voltage in the Label text field.

## Global I

- I Right-click Induced Coil Voltage and choose Global.
- 2 In the Settings window for Global, click Replace Expression in the upper-right corner of the y-Axis Data section. From the menu, choose Component I (compl)> Rotating Machinery, Magnetic (Magnetic Fields)>Coil parameters>rmm.VCoil\_I -Coil voltage - V.

3 In the Induced Coil Voltage toolbar, click Plot.

Next, add the **Time to Frequency Losses** study to compute the loss.

## ADD STUDY

- I In the Home toolbar, click Add Study to open the Add Study window.
- 2 Go to the Add Study window.
- 3 Find the Studies subsection. In the Select Study tree, select Preset Studies for Selected Physics Interfaces>Time to Frequency Losses.
- 4 Click Add Study in the window toolbar.
- 5 In the Home toolbar, click Add Study to close the Add Study window.

#### STUDY 2

Step 1: Time to Frequency Losses

- I In the Settings window for Time to Frequency Losses, locate the Study Settings section.
- 2 From the Input study list, choose Study I, Time Dependent.
- 3 In the Electrical period text field, type 0.25.
- 4 In the Home toolbar, click **Compute**.

#### RESULTS

Volume Integration I

- I In the Results toolbar, click 8.85 More Derived Values and choose Integration> Volume Integration.
- 2 In the Settings window for Volume Integration, locate the Data section.
- 3 From the Dataset list, choose Study 2/Solution 4 (sol4).
- **4** Select Domains 1, 2, 5, 6, 9, 10, 15, and 16 only.
- **5** Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
rmm.Qh*16	W	Loss power

6 Click **= Evaluate**.

The computed loss power is close to the value computed from the 2D model.

#### Animation I

Finally, visualize the rotation of the generator by animating the solution.

- I In the Results toolbar, click Animation and choose Player.
- 2 In the Settings window for Animation, locate the Playing section.
- 3 From the Repeat list, choose Number of iterations.
- 4 In the Number of iterations text field, type 10.
- 5 Click the Go to Default View button in the Graphics toolbar.

6 In the Graphics toolbar, use the Play and Stop buttons to control the animation.
