

# Eigenmodes in a Muffler

## Introduction

---

In this example, you compute the propagating modes in the chamber of an automotive muffler. The geometry is a cross section of the chamber in the [Absorptive Muffler](#) example.

The purpose of the model is to study the shape of the propagating modes and to find their cutoff frequencies. As discussed in the documentation of the Absorptive Muffler example, some of the modes significantly affect the damping of the muffler at frequencies above their cutoff. In this model, you study modes with cutoff frequencies up to 1500 Hz.

## Model Definition

---

The muffler chamber has a race track shaped cross section, as seen in [Figure 1](#). In this model, the chamber is considered to be hollow and filled with air at atmospheric pressure.

*Figure 1: The model geometry.*

The wave numbers and mode shapes through a cross section of the chamber are found as the solution of an eigenvalue problem for the acoustic pressure  $p$ :

$$\nabla \cdot \left( \frac{\nabla p(x, y)}{\rho_0} \right) - \left( \frac{\omega^2}{\rho_0 c^2} - \frac{\kappa_z^2}{\rho_0} \right) p(x, y) = 0$$

where  $\rho_0$  is the density,  $c$  the speed of sound,  $\kappa_z$  the out-of-plane wave number, and  $\omega = 2\pi f$  the angular frequency. For a given angular frequency, only modes such that  $\kappa_z^2$  is positive can propagate. The cutoff frequency of each mode is calculated as

$$f_j = \frac{\sqrt{\omega^2 - c^2 \kappa_z^2}}{2\pi}$$

### *Results and Discussion*

---

The model finds five propagating modes, whose characteristics are summed up in the table here below.

Cutoff frequency (Hz)	Characteristics
0	Plane wave
635	Antisymmetric with respect to x, symmetric with respect to y
1210	Symmetric with respect to x, antisymmetric with respect to y
1240	Symmetric with respect to x and y
1467	Antisymmetric with respect to x and y

For a muffler with a centered tube leading into the chamber, the first mode that is symmetric with respect to both the  $x$ -axis and the  $y$ -axis is propagating when the frequency is higher than 1240 Hz. [Figure 2](#) shows this mode, which for an infinitely long chamber occurs at 1240 Hz.

Figure 2: The chamber's first fully symmetric propagation mode. The plot shows the absolute value of the pressure.

eigenmodes\_in\_muffler

---

### Modeling Instructions

---

From the **File** menu, choose **New**.

#### NEW

In the **New** window, click  **Model Wizard**.

#### MODEL WIZARD

- 1 In the **Model Wizard** window, click  **2D**.
- 2 In the **Select Physics** tree, select **Acoustics>Pressure Acoustics>Pressure Acoustics, Frequency Domain (acpr)**.

- 3 Click **Add**.
- 4 Click  **Study**.
- 5 In the **Select Study** tree, select **Preset Studies for Selected Physics Interfaces> Mode Analysis**.
- 6 Click  **Done**.

## GEOMETRY 1

- 1 In the **Model Builder** window, under **Component 1 (comp1)** click **Geometry 1**.
- 2 In the **Settings** window for **Geometry**, locate the **Units** section.
- 3 From the **Length unit** list, choose **mm**.

### *Square 1 (sq1)*

- 1 In the **Geometry** toolbar, click  **Square**.
- 2 In the **Settings** window for **Square**, locate the **Size** section.
- 3 In the **Side length** text field, type **150**.
- 4 Locate the **Position** section. From the **Base** list, choose **Center**.

### *Circle 1 (c1)*

- 1 In the **Geometry** toolbar, click  **Circle**.
- 2 In the **Settings** window for **Circle**, locate the **Size and Shape** section.
- 3 In the **Radius** text field, type **75**.
- 4 Locate the **Position** section. In the **x** text field, type **-75**.

### *Circle 2 (c2)*

- 1 In the **Geometry** toolbar, click  **Circle**.
- 2 In the **Settings** window for **Circle**, locate the **Size and Shape** section.
- 3 In the **Radius** text field, type **75**.
- 4 Locate the **Position** section. In the **x** text field, type **75**.

### *Union 1 (un1)*

- 1 In the **Geometry** toolbar, click  **Booleans and Partitions** and choose **Union**.
- 2 Click in the **Graphics** window and then press **Ctrl+A** to select all objects.
- 3 In the **Settings** window for **Union**, locate the **Union** section.
- 4 Clear the **Keep interior boundaries** check box.
- 5 Click  **Build All Objects**.
- 6 Click the  **Zoom Extents** button in the **Graphics** toolbar.

## ADD MATERIAL

1 In the **Home** toolbar, click  **Add Material** to open the **Add Material** window.

2 Go to the **Add Material** window.

3 In the tree, select **Built-in>Air**.

4 Click **Add to Component** in the window toolbar.

5 In the **Home** toolbar, click  **Add Material** to close the **Add Material** window.

By default, the boundaries of the geometry will be considered to be sound hard walls.

No other physics settings are needed.

## MESH 1

In this model, the mesh is set up manually. Add a free triangular mesh and then proceed to the solver settings.

### *Free Triangular 1*

In the **Mesh** toolbar, click  **Free Triangular**.

## STUDY 1

### *Step 1: Mode Analysis*

1 In the **Model Builder** window, under **Study 1** click **Step 1: Mode Analysis**.

2 In the **Settings** window for **Mode Analysis**, locate the **Study Settings** section.

3 Select the **Desired number of modes** check box.

4 In the associated text field, type 8.

5 Select the **Search for modes around** check box.

6 In the associated text field, type 20.

The free-space propagation mode has an out-of-plane wave number equal to  $\omega/c = 27.5 \text{ rad/m}$ . With these settings, the solver returns the 8 modes with propagation constants closest to  $20 \text{ rad/m}$  first in the list.

7 In the **Mode analysis frequency** text field, type 1500[Hz].

This setting makes the software look for propagating modes with cutoff frequencies up to 1500 Hz.

8 In the **Home** toolbar, click  **Compute**.

## RESULTS

### Absolute Acoustic Pressure (acpr)

- 1 In the **Settings** window for **2D Plot Group**, type **Absolute Acoustic Pressure (acpr)** in the **Label** text field.

The solver has found the free-space mode and all other propagating modes. There is a total of 5 different propagating modes. Because the waves can propagate both into and out of the modeling plane, each mode gets reported twice, with positive and negative out-of-plane wave numbers.

For the positive out-of-plane wave numbers, it holds that the higher the mode, the lower the wave number. However, the solver does not stop at zero. Because you asked for more than the 5 existing propagating modes, you get additional modes with imaginary out-of-plane wave numbers. This indicates that they are evanescent. The default plot shows the acoustic pressure distribution for a mode with a wave number of  $-17.95i$  rad/m.

- 2 Locate the **Data** section. From the **Out-of-plane wave number (rad/m)** list, choose **15.461**.
- 3 In the **Absolute Acoustic Pressure (acpr)** toolbar, click  **Plot**.
- 4 Click the  **Zoom Extents** button in the **Graphics** toolbar.

This is the lowest fully symmetric mode. In order to reproduce [Figure 2](#), plot the absolute value of the pressure.

### Surface 1

- 1 In the **Model Builder** window, expand the **Absolute Acoustic Pressure (acpr)** node, then click **Surface 1**.
- 2 In the **Settings** window for **Surface**, click **Replace Expression** in the upper-right corner of the **Expression** section. From the menu, choose **Component 1 (comp1)> Pressure Acoustics, Frequency Domain>Pressure and sound pressure level>acpr.absp\_t - Absolute total acoustic pressure - Pa.**
- 3 Locate the **Coloring and Style** section. From the **Color table** list, choose **Prism**.
- 4 From the **Scale** list, choose **Linear**.
- 5 In the **Absolute Acoustic Pressure (acpr)** toolbar, click  **Plot**.
- 6 Click the  **Zoom Extents** button in the **Graphics** toolbar.

You can compute the cutoff frequency of this mode using the expression in the model introduction. In order to refer to the speed of sound in air, use an arbitrary point in the geometry for this evaluation.

### Point Evaluation 1

- 1 In the **Results** toolbar, click  **Point Evaluation**.
- 2 In the **Settings** window for **Point Evaluation**, locate the **Data** section.
- 3 From the **Out-of-plane wave number selection** list, choose **From list**.
- 4 In the **Out-of-plane wave number (rad/m)** list, select **15.461**.
- 5 Select Point 3 only.
- 6 Locate the **Expressions** section. In the table, enter the following settings:

Expression	Unit	Description
$\sqrt{acpr.\omega^2 - acpr.kz^2 * acpr.c^2} / (2 * \pi)$	rad/s	

- 7 Click  **Evaluate**.
