

Step-Index Fiber

The data transmission speed of optical waveguides is superior to microwave waveguides because optical devices have a much higher operating frequency than microwaves, enabling a far higher bandwidth.

Today the silica glass (SiO₂) fiber is forming the backbone of modern communication systems. Before 1970, optical fibers suffered from large transmission losses, making optical communication technology merely an academic issue. In 1970, researchers showed, for the first time, that low-loss optical fibers really could be manufactured. Earlier losses of 2000 dB/km now went down to 20 dB/km. Today's fibers have losses near the theoretical limit of 0.16 dB/km at 1.55 µm (infrared light).

One of the winning devices has been the single-mode fiber, having a step-index profile with a higher refractive index in the center core and a lower index in the outer cladding. Numerical software plays an important role in the design of single-mode waveguides and fibers. For a fiber cross section, even the simplest shape is difficult and cumbersome to deal with analytically. A circular step-index waveguide is a basic shape where benchmark results are available (see Ref. 1).

This example is a model of a single step-index waveguide made of silica glass. The inner core is made of pure silica glass with refractive index $n_1 = 1.4457$ and the cladding is doped with a refractive index of $n_2 = 1.4378$. These values are valid for free-space wavelengths of 1.55 µm. The radius of the cladding is chosen to be large enough so that the field of confined modes is zero at the exterior boundaries.

For a confined mode there is no energy flow in the radial direction, so the wave must be evanescent in the radial direction in the cladding. This is true only if

$$n_{\text{off}} > n_2$$

On the other hand, the wave cannot be radially evanescent in the core region. Thus

$$n_2 < n_{\text{eff}} < n_1$$

The waves are more confined when n_{eff} is close to the upper limit in this interval.

Model Definition

The mode analysis is made on a cross section in the xy-plane of the fiber. The wave propagates in the z direction and has the form

$$\mathbf{E}(x, y, z, t) = \mathbf{E}(x, y)e^{j(\omega t - \beta z)}$$

where ω is the angular frequency and β the propagation constant. An eigenvalue equation for the electric field ${\bf E}$ is derived from Helmholtz equation

$$\nabla \times (\nabla \times \mathbf{E}) - k_0^2 n^2 \mathbf{E} = \mathbf{0}$$

which is solved for the eigenvalue $\lambda = -j\beta$.

As boundary condition along the outside of the cladding, the electric field is set to zero. Because the amplitude of the field decays rapidly as a function of the radius of the cladding this is a valid boundary condition.

Results and Discussion

When studying the characteristics of optical waveguides, the effective mode index of a confined mode,

$$n_{\text{eff}} = \frac{\beta}{k_0}$$

as a function of the frequency is an important characteristic. A common notion is the normalized frequency for a fiber. This is defined as

$$V = \frac{2\pi a}{\lambda_0} \sqrt{n_1^2 - n_2^2} = k_0 a \sqrt{n_1^2 - n_2^2}$$

where α is the radius of the core of the fiber. For this simulation, the effective mode index for the fundamental mode, 1.4444 corresponds to a normalized frequency of 4.895. The

longitudinal components of the electric and magnetic fields for this mode is shown in Figure 1 below.

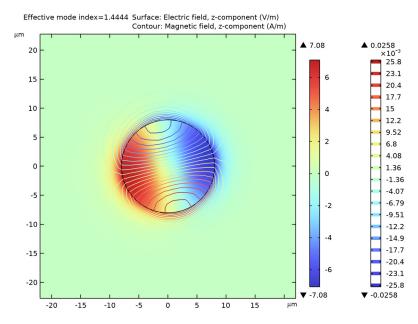

Figure 1: The surface plot visualizes the z component of the electric field. This plot is for the effective mode index 1.4444.

Modeling Instructions

From the File menu, choose New.

NEW

In the New window, click Model Wizard.

MODEL WIZARD

- I In the Model Wizard window, click **2** 2D.
- 2 In the Select Physics tree, select Radio Frequency>Electromagnetic Waves, Frequency Domain (emw).
- 3 Click Add.
- 4 Click Study.
- 5 In the Select Study tree, select Preset Studies for Selected Physics Interfaces> Mode Analysis.
- 6 Click M Done.

GEOMETRY I

- I In the Model Builder window, under Component I (compl) click Geometry I.
- 2 In the Settings window for Geometry, locate the Units section.
- 3 From the Length unit list, choose µm.

Circle I (c1)

- I In the **Geometry** toolbar, click Circle.
- 2 In the Settings window for Circle, locate the Size and Shape section.
- 3 In the Radius text field, type 40.
- 4 Click | Build Selected.

Circle 2 (c2)

- I In the **Geometry** toolbar, click Circle.
- 2 In the Settings window for Circle, locate the Size and Shape section.
- 3 In the Radius text field, type 8.
- 4 Click **Build Selected**.

MATERIALS

Doped Silica Glass

- I In the Model Builder window, under Component I (compl) right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Doped Silica Glass in the Label text field.
- 3 Select Domain 2 only.
- 4 Click to expand the Material Properties section. In the Material properties tree, select Electromagnetic Models>Refractive Index>Refractive index, real part (n).

- 5 Click + Add to Material.
- **6** Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group	
Refractive index, real part	n_iso ; nii = n_iso, nij = 0	1.4457	1	Refractive index	

Silica Glass

- I Right-click Materials and choose Blank Material.
- 2 In the Settings window for Material, type Silica Glass in the Label text field.
- 3 Select Domain 1 only.
- 4 Click to expand the Material Properties section. In the Material properties tree, select Electromagnetic Models>Refractive Index>Refractive index, real part (n).
- 5 Click + Add to Material.
- **6** Locate the **Material Contents** section. In the table, enter the following settings:

Property	Variable	Value	Unit	Property group		
Refractive index, real part	n_iso ; nii = n_iso, nij = 0	1.4378	I	Refractive index		

ELECTROMAGNETIC WAVES, FREQUENCY DOMAIN (EMW)

Keep the default physics settings, which include perfect electric conductor conditions for the outer boundaries.

Wave Equation, Electric 1

- I In the Model Builder window, under Component I (compl)>Electromagnetic Waves, Frequency Domain (emw) click Wave Equation, Electric 1.
- 2 In the Settings window for Wave Equation, Electric, locate the Electric Displacement Field section.
- 3 From the Electric displacement field model list, choose Refractive index.

MESH I

- I In the Model Builder window, under Component I (compl) click Mesh I.
- 2 In the Settings window for Mesh, locate the Physics-Controlled Mesh section.
- 3 In the table, clear the Use check box for Electromagnetic Waves, Frequency Domain (emw).
- 4 From the Element size list, choose Finer.

5 Click Build All.

STUDY I

Step 1: Mode Analysis

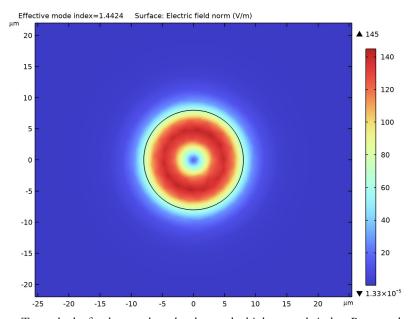

- I In the Model Builder window, under Study I click Step I: Mode Analysis.
- 2 In the Settings window for Mode Analysis, locate the Study Settings section.
- 3 Select the Search for modes around check box. In the associated text field, type 1.446. The modes of interest have an effective mode index somewhere between the refractive indices of the two materials. The fundamental mode has the highest index. Therefore, setting the mode index to search around to something just above the core index guarantees that the solver will find the fundamental mode.
- 4 In the Mode analysis frequency text field, type c const/1.55[um]. This frequency corresponds to a free space wavelength of 1.55 µm.
- 5 In the Home toolbar, click **Compute**.

RESULTS

	ectric								
ı	Click	the	\bigoplus	Zoom	Extents	button	in the	Graphics	toolbar.

2 Click the **Q** Zoom In button in the Graphics toolbar.

The default plot shows the distribution of the norm of the electric field for the highest of the 6 computed modes (the one with the lowest effective mode index).

To study the fundamental mode, choose the highest mode index. Because the magnetic field is exactly 90 degrees out of phase with the electric field you can see both the magnetic and the electric field distributions by plotting the solution at a phase angle of 45 degrees.

Study I/Solution I (soll)

- I In the Model Builder window, expand the Results>Datasets node, then click Study I/ Solution I (soll).
- 2 In the Settings window for Solution, locate the Solution section.
- 3 In the Solution at angle (phase) text field, type 45.

Electric Field (emw)

- I In the Model Builder window, under Results click Electric Field (emw).
- 2 In the Settings window for 2D Plot Group, locate the Data section.
- 3 From the Effective mode index list, choose 1.4444.

Surface

- I In the Model Builder window, expand the Electric Field (emw) node, then click Surface.
- 2 In the Settings window for Surface, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)> Electromagnetic Waves, Frequency Domain>Electric>Electric field - V/m>emw.Ez -Electric field, z-component.
- 3 In the Electric Field (emw) toolbar, click Plot. Add a contour plot of the H-field.

Contour I

- I In the Model Builder window, right-click Electric Field (emw) and choose Contour.
- 2 In the Settings window for Contour, click Replace Expression in the upper-right corner of the Expression section. From the menu, choose Component I (compl)> Electromagnetic Waves, Frequency Domain>Magnetic>Magnetic field - A/m>emw.Hz -Magnetic field, z-component.
- 3 In the Electric Field (emw) toolbar, click Plot. The distribution of the transversal E and H field components confirms that this is the HE11 mode. Compare the resulting plot with that in Figure 1.
